Release Letter

Products:	<i>Combined Signed Firmware for CPP7.3 UHD/HD/MP cameras CPP7 HD/MP cameras CPP6 UHD/MP cameras CPP4 HD cameras</i>
Version:	<i>7.82.1013</i>

This letter contains latest information about the above mentioned firmware version.

1 General

This firmware release is a combined and signed firmware package, applicable to H.264 and H.265 products based on one of the following platforms.
It can be used to upgrade firmware on cameras of the applicable platforms running firmware version 6.51 or higher.

This combined and signed firmware supports platforms only that force a two-factor authenticated release signature and accept encrypted firmware files to help increase the overall security level.

From

BT-VS/MKP

Product Management

Nuremberg

14.12.2021

This firmware supports:

- CPP7.3 HD and UHD cameras
 - [upgrade from FW 6.51 or newer to latest FW 7.82](#)
- CPP7 HD cameras
 - [upgrade from FW 6.51 or newer to latest FW 7.82](#)
- CPP6 HD and UHD cameras
 - [upgrade from FW 6.51 or newer to latest FW 7.82](#)
- CPP4 HD and MP cameras
 - upgrade from FW 6.51 or newer to latest FW 7.10

The combined firmware package includes the following build versions:

- [CPP7.3 FW 7.82.0025](#)
- [CPP7 H.264 7.82.0025](#)
- [CPP6E H.264 7.82.00250](#)
- [CPP6 H.264 7.82.0025](#)
- [CPP4 H.264 7.10.0095](#)

For detailed description please refer to the separate release letters.

2 Important notes

2.1 End of Feature for CPP4 – Maintenance mode started

With release of FW 7.10, feature implementation for the CPP4 platform ends, and the firmware development will switch over into maintenance mode. The firmware branch for CPP4 is now treated as a **long-term supported firmware (LTSFW)**, with its code base frozen to allow bug fixing and applying security fixes where necessary.

2.2 Two-factor authenticated firmware signature

The security of the signature of the firmware file has been strengthened by using a two-factor authentication process for signing the final firmware file. This new process has been prepared for with firmware 6.50 and comes into effect with succeeding versions, from firmware 6.51 onwards.

The new signature protects from non-released versions being installed in production systems. As a result, pre-release (beta) versions, required sometimes in projects, need to have a special license installed prior to the firmware update. Requests for pre-release versions need to be handled via tech support tickets in order to allow tracking and require a concession signed by the customer.

Note:

This combined firmware file is not applicable to devices running firmware older than FW 6.51 due to the two-factor authenticated release signature and firmware file encryption.

For such devices apply the unsigned combined firmware file or the platform-specific firmware up to firmware 6.51 before using this combined and signed firmware.

2.3 Firmware file encryption

This combined and signed firmware includes signed and encrypted firmware files only. Thus, only platforms that support firmware file decryption are applicable to this combined and signed firmware.

2.4 Secure Element (“TPM”)

All devices incorporate a secure microcontroller, which we call our Secure Element.

“A Secure Element is a tamper-resistant platform capable of securely hosting applications and their confidential and cryptographic data (for example cryptographic keys) in accordance with the rules and security requirements set by well-identified trusted authorities.”¹ In this specific case the requirements are defined in the Trusted Platform Module library specification defined by the Trusted Computing Group (TCG). As the Secure Element supports the main functionalities specified by TCG, the ones needed for an IoT device, it is often referred to as a “TPM”.

Due to security reasons, the firmware or functionality of the secure crypto-microcontroller cannot be altered in the field.

Thus, not all new security features become available on devices with older secure crypto-microcontroller hardware or firmware revisions.

2.5 Open Source Software

Bosch Security Systems is advocate of integrating open source software into its products. The use of open source software is noted in the *Service* menu on the *System Overview* page of every camera's web interface. For general information regarding open source software in Bosch Security Systems, please visit <http://www.boschsecurity.com/oss> .

4 New Features for CPP7.3

- Support of VCA profiles has been extended to 32, providing more flexibility in assignment to PTZ prepositions and allowing coverage of 360 degree view with 32 sectors, even for zoomed-in thermal camera.
Due to this extension and a 4 bit limit for the profile number in the metadata stream, metadata searches are now restricted to 14 individual profiles only, as profile number 15 is reserved for marking 'extended profile' in use.
- With the special 'extended basemode' license installed, it is now possible to select the cropped resolution 1280x960 for stream 2. It is also possible to select the encoder source when using CGI parameter 'JpegSourceEncoder' to retrieve a snap.jpg of a cropped resolution stream from the camera.
- Firmware version 7.81 introduced an additional check on the HTTP referrer, an improvement to reduce the vulnerability for Cross Site Request Forgery (CSRF) attacks. For backward compatibility with legacy clients, applicable where alternative measures are put in place, this check can be disabled via the user interface.
- For TLS usage and 802.1x certificate verification, SHA384 hashing is now supported.
- For 802.1x, server certificate verification can be disabled, when a specific global license is installed. A server certificate is then no more required or will not be considered if installed. The license key to disable the server certificate verification is:
 - 12-01.48.01-3C683BD3-54B029FA-7E5ADCC5-6F29CD7F-55B0528EThe license key to enable the server certificate verification is:
 - 12-01.48.00-EE2A44C1-EE5CC9E0-0BB6FBBD-2B582636-2CBBB1FC

1 Changes for CPP7.3

- An issue, introduced with FW 7.81, where the ONVIF command `GetEventProperties` did not show the old IVA events nor the new `RuleEngine` events anymore, is fixed. With FW 7.82 it will show the configured `RuleEngine` events. A proper implementation should use the ONVIF commands `GetRules` and `GetSupportedRules` for a comprehensive rule presentation.
- An issue with internal adaptation of the iSCSI MSS when the MTU value is changed is fixed.
- An issue with thermal settings lost when changing parameters on the visual line is fixed.
- An issue where the camera did not receive an IP address via DHCP after 802.1x authentication is completed is fixed.
- An issue where MIC 9000 sporadically showed no thermal video after reboot is fixed.
- An issue with increased response time for ONVIF Profile M event handling via MQTT is fixed.
- Due to a change in the Dropbox API, the support for Dropbox will be deprecated. We are working on providing an alternative, which will be announced with a future firmware version.

4 New Features for CPP6

- Firmware version 7.81 introduced an additional check on the HTTP referrer, an improvement to reduce the vulnerability for Cross Site Request Forgery (CSRF) attacks. For backward compatibility with legacy clients, applicable where alternative measures are put in place, this check can be disabled via the user interface.
- For TLS usage and 802.1x certificate verification, SHA384 hashing is now supported.
- For 802.1x, server certificate verification can be disabled, when a specific global license is installed. A server certificate is then no more required or will not be considered if installed. The license key to disable the server certificate verification is:
 - 12-01.48.01-3C683BD3-54B029FA-7E5ADCC5-6F29CD7F-55B0528EThe license key to enable the server certificate verification is:
 - 12-01.48.00-EE2A44C1-EE5CC9E0-0BB6FBBD-2B582636-2CBBB1FC

5 Changes for CPP6

- An issue, introduced with FW 7.81, where the ONVIF command GetEventProperties did not show the old IVA events nor the new RuleEngine events anymore, is fixed. With FW 7.82 it will show the configured RuleEngine events. A proper implementation should use the ONVIF commands GetRules and GetSupportedRules for a comprehensive rule presentation.
- An issue with internal adaptation of the iSCSI MSS when the MTU value is changed is fixed.
- An issue where the camera did not receive an IP address via DHCP after 802.1x authentication is completed is fixed.
- An issue with increased response time for ONVIF Profile M event handling via MQTT is fixed.
- Due to a change in the Dropbox API, the support for Dropbox will be deprecated. We are working on providing an alternative, which will be announced with a future firmware version.

Please check the platform-specific [release notes of FW 7.82.0025](#) for completeness and details.

6 Restrictions; Known Issues

- This combined firmware file is not applicable to devices running firmware older than FW 6.51 due to the two-factor authenticated release signature and firmware file encryption.
- Video authentication using SHA hashing mechanisms are not functional if no self-signed certificate has been created yet. Opening an HTTPS connection once is prerequisite.
- Cameras with security coprocessor version 3 with an externally applied certificate will fail HTTPS connections requesting SHA256. The restriction applies to all functions using the private key from the certificate, including
 - EAP-TLS with client authentication
 - TLS-Time with client authentication
 - TLS-Syslog with client authentication

With self-signed certificate, HTTPS is fully functional.

- Creating 2048 bit keys for self-signed certificates may take more than 20 seconds, extending the initial boot cycle, which may occasionally cause a timeout on the very first HTTPS connection to a camera. The next connection attempt typically is successful.
- Software sealing does not cover all static parameters of image pre-processing and moving camera control.
- If software sealing is active and SNMP is disabled in Network -> Network Services, no SNMP trap will be sent out on seal break due to the disabled service. The seal break itself is logged.
- Creating 2048 bit keys for self-signed certificates may take more than 20 seconds, extending the initial boot cycle, which may occasionally cause a timeout on the very first HTTPS connection to a camera. The next connection attempt typically is successful.
- Software sealing does not cover all static parameters of image pre-processing and moving camera control.
- If software sealing is active and SNMP is disabled in Network -> Network Services, no SNMP trap will be sent out on seal break due to the disabled service. The seal break itself is logged.
- This combined firmware file is not applicable to devices running firmware higher than FW 6.50 due to the 2-factor release signature.
- AVIOTEC firmware is not included in this combined firmware file.

Please check the respective release letter of a camera or encoder for further device-specific restrictions.
