Note

This manual was compiled with the greatest of care and all information double checked. At the time of printing the description was complete and correct. Because of the further development of products, the content of the manual might change without prior notice. Bosch Security Systems will not be liable for damage which is directly or indirectly due to errors, incompleteness, or discrepancies between the manual and the product described.

Trade marks

All names used in this manual for hardware and software are very probably registered trade marks and must be treated as such.

Transport Protocol

The transport protocol for this remote control must be TCP. All VideoJets will establish a TCP listen socket on port **1756**. Any remote control must be sent to this port. Multiple RCP connections from the same endpoints are allowed. The maximum number of RCP connections on a single endpoint is limited to 50 connections at the same time. Alternatively, a connection can be made using a HTTP tunnel. See this chapter for details.

Remote Control ProtocolPlus Protocol Header Layout

Version 3 (VIP, VideoJet and VipX Series and VIP110Version 6.0 and higher). The RCP Plus protocol header consists of 16 Bytes. The begin of the payload section is now on DWORD boundary.

16					32		
Tag 2 Bytes				Data Type 1 Byte	Version 4 Bits	R/W 4 Bits	
C 1	T 1	Action 6 Bits	Reserved 1 Byte	Client ID 2 Bytes			
Session ID 4 Bytes							
Numeric Descriptor 2 Bytes				Payload Length 2 Bytes			
8				24			

Tag

Each tag is represented by two octets. It identifies the command which should be processed by the VideoJet.

Data Type

Specifies the data type of the payload section. These are the currently available data types:

Values:

F_FLAG	0x00 (1 Byte)
T_OCTET	0x01 (1 Byte)
T_WORD	0x02 (2 Byte)
T_INT	0x04 (4 Byte)
T_DWORD	0x08 (4 Byte)
P_OCTET	0x0C (N Byte)
P_STRING	0x10 (N Byte)
P_UNICODE	0x14 (N Byte)

Version

The current RCP version is 3. Backward compatibility to version 2 or version 0 is NOT provided.

R/W

Specifies whether the command should read or write. The Read/Write field is coded in the lower nibble of byte 4.

Values:

Read	0x0
Write	0x1

T

StringTable available. This bit signals, when set, that there is a string table appended to this RCP+ packet which contains IPv6 addresses or host names.

C

Continuation. This bit signals, when set, that this RCP+ packet is not terminated in the payload; additional packets with the full RCP+ header will follow immediately in the stream as long as this bit is cleared. The reassembly of the complete payload is up to the application and is beyond the scope of this document.

Action

Specifies the kind of the packet.

Values:

Request	0x00
Reply	0x01
Message	0x02
Error	0x03

Client ID

Each RCP client register results in a Client ID; this ID has to be provided in all following RCP commands.

Session ID

This ID is used for implementations which need to identify a once registered user in other applications or RCP sessions.

Numeric Descriptor

The Numeric Descriptor specifies an attribute for components which are installed more than one time inside the VideoJet, e.g. inputs or relays. The first component is always counted as 1. If this field is not applicable to the command in this packet, a value of zero should be inserted.

Payload Length

The number of data bytes inside the payload section. The length field itself is not counted.

Reserved

This byte is returned by the VideoJet unchanged. It is up to the user to setup a request ID here to assign the replies to multiple pending requests .

Packetizing in the TCP Stream

As TCP is a stream oriented protocol, packetizing information has to be inserted to achieve proper packet reconstruction. For this purpose the TPKT structure is used.

		16	32
Version 1 Byte	Reserved 1 Byte	Length 2 Bytes	
RCP Packet N Bytes			
8		24	

Version

TPKT version 3.

Reserved

Should be set to zero.

Length

Byte count of the complete packet; RCP packet length + TPKT length (4 Bytes).

RCP Protocol Procedure

Request / Reply

The VideoJet unit will send back a reply on each incoming request. In some protocol functions the reply will carry no data.

NOTE: A reply from a write command which is not readable will be an RCP_ERROR_READ_NOT_SUPPORTED (error code 0x90) This means that it is not possible to determine correct setting of the command.

Messages

A message will be generated on the VideoJet on certain events (see RCP command for details). If an RCP client is registered to receive a certain message (e.g. an input state has changed), the VideoJet will generate it. The message has the same payload format as the response to a Read command of the same tag, except the reserved byte. The reserved byte is used as sequence number.

RCP is capable of sending messages on certain events. Before an RCP client can receive these messages, a registration at the VideoJet is necessary.

RCP Errors

The packet will have the standard layout with the method field set to 'Error'. The first bytes of the payload section contains error cause. If the error code is RCP_ERROR_COMMAND_SPECIFIC, then the command specific error (see RCP command for details) is included in the second byte. The following generic error codes are defined:

RCP_ERROR_UNKNOWN	0xFF
RCP_ERROR_INVALID_VERSION	0x10
RCP_ERROR_NOT_REGISTERED	0x20
RCP_ERROR_INVALID_CLIENT_ID	0x21
RCP_ERROR_INVALID_METHOD	0x30
RCP_ERROR_INVALID_CMD	0x40
RCP_ERROR_INVALID_ACCESS_TYPE	0x50
RCP_ERROR_INVALID_DATA_TYPE	0x60
RCP_ERROR_WRITE_ERROR	0x70
RCP_ERROR_PACKET_SIZE	0x80
RCP_ERROR_READ_NOT_SUPPORTED	0x90
RCP_ERROR_INVALID_AUTH_LEVEL	0xA0
RCP_ERROR_INVALID_SESSION_ID	0xB0
RCP_ERROR_TRY_LATER	0xC0
RCP_ERROR_TIMEOUT	0xD0
RCP_ERROR_NO_LICENCE (used by NVR only)	0xE0
RCP_ERROR_COMMAND_SPECIFIC	0xF0
RCP_ERROR_ADDRESS_FORMAT	0xF1

Note the error code 0xC0 RCP_ERROR_TRY_LATER indicates, that the VideoJet recognizes the command, but it cannot be processed immediately. The client should repeat this command later.

A list of all defined command specific error codes can be found in the Appendix.

RCP over a HTTP tunnel

Many network installations includes firewalls to protect network segments against unauthorized access. In many cases, the HTTP port (80) is enabled by default to gain Internet access. For this purpose, RCP offers a second network port. As the VideoJet has a built in webserver, the connection can be made to the webserver, the token

```
"GET /rcp_tunnel HTTP/1.0\r\n\r\n"
```

advices the webserver to pass this socket to the RCP server. From that point on, the client is connected to the RCP server and can immediately continue with RCP registration.

Note: the delimiters '\r' and '\n' are written here in C notation; in the TCP packet to the server these delimiters corresponds with the ASCII codes 0x0d and 0x0a.

Example:

1. Establish a TCP connection to port 80 at your Videjet
2. Send the string "GET /rcp_tunnel HTTP/1.0\r\n\r\n" (as HEX string: 0x47 0x45 0x54 0x20 0x2f 0x72 0x63 0x70 0x5f 0x74 0x75 0x6e 0x6e 0x65 0x6c 0x20 0x48 0x54 0x54 0x50 0x31 0x2e 0x30 0x0d 0x0a 0x0d 0x0a)
3. Proceed in the same manner as a normal RCP connection

Receiving media data

The VideoJet is capable for tunneling media data through HTTP. In some network environments this might be helpful.

When using this mechanism, the connect primitive must set the "RTP over TCP" for the media encapsulation protocol. The response for Media host and port can be ignored. After that, a TCP connection to the HTTP port must be established. By sending the string

GET /media_tunnel/SSSSSSSS/CC/DD/LL/CO HTTP/1.0\r\n\r\n	
SSSSSSSS	The session ID returned from the connect primitive (padded with leading zeros to 8)
CC	The media type (see connect primitive; 01=video, 02=audio)
DD	direction of media (01=receive media, 00=transmit media)
LL	the line input number
CO	The relative coder number

When the HTTP server inside the VideoJet received this string, it passes this socket to the RCP. From that point on, media data will be transferred over this socket using TPKE encapsulation (see chapter Packetizing in the TCP Stream).

The coder numbers that have to be used to establish the media tunnels is a relative one that isn't unique when using video as media type. The video and meta data can have the same relative coder number and have the same media type. In that case the optional index parameter might be used to distinguish the media channels:

```
GET /media_tunnel/SSSSSSSS/CC/DD/LL/CO?index=n HTTP/1.0\r\n\r\n
```

where n is the number of the initial connect primitive channel position starting at 1.

E.g the ConnectPrimitive request contains a Get Video, a Get Audio and a Get Meta section, then the index for video would be 1, the index for audio 2 and the index for meta would be 3.

When all sockets of a session are in data sending mode, a RCP message MEDIA_SOCKETS_COMPLETE with the associated session ID will be sent out to the initiator of the session. This is useful when a session is used for replay; the replay PLAY command can securely be applied when the MEDIA_SOCKETS_COMPLETE message has been arrived.

RCP over CGI

RCP+ command may also be encapsulated in CGI (Common Gateway Interface) using a standard web browser's URL. All needed parameters are passed to the HTTP server of the video server which tunnels the RCP+ commands to the RCP server. The reply returned is a text based XML structure.

The CGI interface may also be used by a HTTP client written from the scratch based on RFC 1945 (HTTP 1.0) using 'GET' method. The unit's HTTP server will only examine 'Connection: Keep-Alive' and optional 'Authorization: ' header fields. See RFC for implementing details.

Valid CGI parameters:

command

Values:

The RCP+ command tag number

type

Values:

- F_FLAG
- T_OCTET
- T_WORD
- T_DWORD
- P_OCTET
- P_STRING
- P_UNICODE

direction

Values:

- READ
- WRITE

num

Values:

The numeric parameter

payload

Values:

- The payload as readable string for payload type P_STRING
- The payload as octet array with no spaces preceeded with 0x for payload type P_OCTET and P_UNICODE
- The payload value in hex or decimal notion for all other payload types

Optional CGI parameters:

idstring

Values:

User defined parameter which will not be processed by the unit; will return unchanged in the reply

sessionid

Values:

Context specific session ID for this command

Multiple parameters are passed in CGI manner with '&' in between two parameter-value pairs.

A sample request to readout the unit's hardware version will look like

http://ip.ip.ip.ip/rcp.xml?command=0x002e&type=P_STRING&direction=READ

The reply XML structure will then have this format:

```
<rcp>
  <command>
    <hex>0x002e</hex>
    <dec>46</dec>
  </command>
  <type>T_DWORD</type>
  <direction>READ</direction>
  <num>0</num>
  <idstring />
  <payload />
  <result>
    <hex>0xf000f43</hex>
    <dec>4026535747</dec>
  </result>
</rcp>
```

The upper part contains the request, the <result> contains the reply. Numerical values are presented in <hex> and <dec>, strings, unicodes and p_octet in <str> sections.

Message handling

RCP+ messages will be processed and received by the CGI client using a poll mechanism. A CGI command set with the requested messages command tag numbers need to be issued. After issuing a request, the reply returns immediately after a message has been sent or the default timeout of 1000 ms has been expired. When the timeout expires, an empty message list is returned. Otherwise the received messages are listed. If there are several messages in the list, they are ordered from oldest to newest. The default timeout can be altered by setting the 'collectms' CGI value to the appropriate number of milliseconds. In order to ensure correct assignment of messages in case several clients are polling for messages or if a polling client uses different socket connections, a unique message domain ID (CGI parameter 'msgdomainID') should be provided. Messages are then collected separately for each ID and can be uniquely assigned to the polling client even if requesting via different socket connections.

Valid CGI commands to control messages:

message

Values:

One or a list of requested message RCP+ command tag numbers separated by '\$'

collectms

Values:

Time in milliseconds to collect messages before returning with 'No messages'; default is 1000 ms; maximum is 60000 (1 minute)

msgdomainID

Values:

Unique ID (maximum 4 Bytes) to identify a certain polling client and to e.g. ensure correct message assignment to clients sending requests via different socket connections. The ID is chosen by the polling client

A buffer mechanism ensures that no messages will be lost during two consecutive poll cycles. The maximum buffering time is 10 seconds after the last poll request returned (either with a message list or due to timeout).

A sample request to receive all connection related messages (CONF_CONNECT_TO) will look like:

`http://ip.ip.ip.ip/rcp.xml?message=0xffcc&collectms=5000`

The reply XML structure will then have this format:

```
<message_list>
  <msg>
    <command>0xffcc</command>
    <num>0</num>
    <sessionID>0x7063001f</sessionID>
    <hex>0xa00a0034000000000101000001010001</hex>
  </msg>
  <msg>
    <command>0xffcc</command>
    <num>0</num>
    <sessionID>0x70630020</sessionID>
    <hex>0xa00a0034000000000101000001010001</hex>
  </msg>
</message_list>
```

Authentication

The RCP+ server needs proper authentication to process protected commands. The CGI interface provides two basic authentication schemes to be used.

Using http authentication

In this case, HTTP header authentication (basic or digest) must be present in the request. The internal HTTP server will pass the granted authorization level to the RCP+ server.

Using session cookie

For each successful HTTP authentication (for all available resources like html pages, images...) a session cookie will be returned by the HTTP server. When this cookie is present in any further HTTP connections, the same authorization level will be granted as for the originating connection. The session cookie will remain active as long as at least one HTTP connection remains open. In this case the internal HTTP server will pass the granted authorization level to the RCP+ server.

IPv6

For RCP commands which are defined as T_DWORD or P_OCTET and contain DWORD IP-Addresses

There is a extension to read or write also IPv6 addresses or Hostnames

e.g. URL:

`http://ip.ip.ip.ip/rcp.xml?`

`command=0x0a1f&type=T_DWORD&direction=WRITE&payload=0x00000000&ip-item0=fd00::55:77`

or

`http://ip.ip.ip.ip/rcp.xml?`

`command=0x0a1f&type=T_DWORD&direction=WRITE&payload=0x00000000&ip-`

item0=MyHostname.de

Where payload must contain a 4 byte index to the trailing list of ip-item0..ip-itemn

The reply XML structure will then have this format:

```
<rcp>
  <command>
    <hex>0x0a1f</hex>
    <dec>2591</dec>
  </command>
  <type>T_DWORD</type>
  <direction>READ</direction>
  <num>0</num>
  <idstring />
  <payload />
  <result>
    <hex>0x00000000</hex>
    <dec>0</dec>
    <ip-table>
      <item>
        <idx>0</idx>
        <type>IPv6</type>
        <str>fd00::55:77</str>
      </item>
    </ip-table>
  </result>
</rcp>
```

Where payload contains a 4 byte index to the ip-table list for each address contained in the command

if the command datatype is P_OCTET and the command does contain more IP-Addresses then the result will contain multiple item blocks.

Alternative formats for the item blocks are also possible:

```
<item>
  <idx>1</idx>
  <type>IPv4</type>
  <str>192.168.1.2</str>
</item>

<item>
  <idx>2</idx>
  <type>NAME</type>
  <str>MyHostname.de</str>
</item>
```

If a list is supplied the ALL addresses MUST be in the list also in the case that they are IPv4 type

Autodetecting Devices

Bosch Security Systems products are being detected on a network using an IP broadcast to either the static UDP port **1757** or to the configurable UDP discover port. The default port number for the configurable discover port is **1800**, and it can be modified with the RCP command CONF_DISCOVER_PORT (0x0976). In addition to the possibility to send a scan request packet to the broadcast destination address of 255.255.255.255, the discover port of the devices listens for scan requests sent to the configurable multicast group, which can be set by means of the RCP command CONF_AUTODETECT_REPLY_GROUP (0x0956). The default multicast detect group is 225.86.67.83.

Devices generate and transmit their replies to an autodetect request with a random delay of up to 2 seconds. When implementing your own detection software, please bear in mind that, when calculating the necessary waiting period until all replies are received, additionally to the possible span of max 2 seconds, you need to consider the time necessary to process the reply as well as the time the packet spends on the wire and in propagation devices like switches or routers on its way to and back from the device to be detected.

The scanned devices send their replies either to the source IP address of the request, or to the broadcast address 255.255.255.255. In case the source IP address of the request resides inside the same subnet, that is defined by the scanned device's IP address and it's subnet mask, the reply is addressed to the source IP address in the request. If the originator is not located in the same subnet as the scanned device, the reply is addressed to the broadcast address 255.255.255.255. In case of a scan request sent to the device via the multicast scan group, the reply is addressed to the same multicast group.

An autodetect scan request packet must consist of an autodetect request header, that may or may not be preceded by an RCP plus protocol header for command id CONF_RCP_AUTODETECT (0xffdc). In case of an existing RCP plus protocol header in the scan request, the length field of the RCP plus protocol header must contain the length of the autodetect request header.

The format for the autodetect request header as well as for the autodetect reply is shown below:

Autodetect Request Header

16		32	
0x99 1 Byte	0x39 1 Byte	0xA4 1 Byte	0x27 1 Byte
Sequence Number 4 Bytes			
Device Group 1 Byte	Hardware ID 1 Byte	Reply Port 2 Bytes	
8		24	

Sequence Number

This sequence number must be a randomized number.

Device Group

Set the Device Group byte to 0xFF, to scan for all devices. Use value of 0x00 to scan for transmitters and 0x01 to scan for receivers.

Hardware ID

Set the Hardware ID byte to 0x00, to scan for all devices. Use the respective Hardware ID byte to scan for devices of that model.

Reply Port

Specifies the reply UDP port e.g. RP1 0x06; RP2 0xDE -> reply port: 1758

Sequence Number

Returns the sequence number from the request packet.

Hardware Address

MAC address of the device.

ID

Unit Hardware ID returned from request (will be 0xff when the new version layout is used).

Device IP

Current IP address of the device.

Subnet Mask

Current Subnet mask of the device.

Gatway IP

Current Gateway of the device.

Flavor

Flavor of this device.

Connections

Number of active connections.

ID new

The ID filed of the new version layout.

<ClusterID>XX</ClusterID>
XX is index number of the above ClusterMember list of this device

<deviceCapabilities>XXXXXXXXXX...XX</deviceCapabilities>
XXXXXXXXXX...XX is a subset of the binary payload of the reply to the command CONF_DEVICE_CAPABILITIES
(each byte is printed with %2x) and can help to identify the availability of features or the capabilities of this device.
The number of bytes given in this section can vary depending on the device and the firmware version.
The following device capability tags are supported: DEVICE_TYPE, PTZ_CAMERA, NBR_VIDEO_IN, PLATFORM_TYP, VIRTUAL_LINES.
```

Optional Extension: Targeting Autodetect Scans at devices matching certain criteria

The autodetect process can be targeted at a certain group of devices identified by a defined criteria. This sort of autodetect is device-wise only handled, when sent to the configurable UDP port, whose default port number is 1800. It is **not** possible via the static autodetect port 1757. To perform a targeted autodetect scan, an extension needs to be added to the usual autodetect scan command. For these targeted kinds of autodetect scans, it is obligatory that the scan packet consists of an RCP plus protocol header, the autodetect request header and the extension itself. The bytes of this extension are considered in the length field of a preceeding RCP header.

16	32
Scan Extension Identifier	
4 Bytes	
Size	
4 Bytes	

Scan Extension Identifier

The scan extension identifier determines the criteria that needs to be matched by the scanned devices in order to reply to the request. Currently the following possible criteria are defined:

MAC address	0x1
-------------	-----

Size

The Size field of the extension informs about the number of bytes used in the extension. The number includes the 4 bytes of the Scan Extension Identifier field, the 4 bytes of the Size field itself and the length of the following payload in bytes.

In case of the MAC address extension, the Size field is followed by one or more MAC addresses of 6 bytes length each. A scan extension limiting the autodetect scan to 2 devices, the size field of the scan extension should contain a value of 20. (4 bytes Scan Extension Identifier + 4 bytes Length + 6 bytes first MAC address + 6 bytes second MAC address)

Retrieving thumbnail JPEGs using the Autodetecting Broadcast Mechanism

The Bosch Security Systems products support a mechanism that allows to retrieve thumbnail JPEGs via a broadcast autodetect mechanism. The mechanism requires to send a UDP packet similar to the autodetect scan packet to the configurable autodetect port of the device, whose default port number is 1800. The device replies with a packet containing the thumbnail JPEG. The JPEG retrieval can not be accomplished via the static autodetect port 1757.

Format of the request packet of an autodetect based JPEG request

The request packet triggering the autodetect based JPEG retrieval consists of an RCP plus

protocol header and an autodetect based JPEG request header, followed by a MAC list scan extension.

RCP plus protocol header

The RCP plus protocol header's command id field is set to 0x099e (CONF_JPEG). The data type field is set to 0x0c (P_OCTET). The numeric descriptor field identifies the line of the targeted device, from which the JPEG is to be retrieved. The length field of the request indicates the number of payload bytes and therefore is to be set to the length of the autodetect based JPEG request header plus the length of the scan extension (e.g. 12 bytes for autodetect based JPEG request header, 8 bytes for scan extension header and 6 bytes for MAC address = 26 bytes).

Autodetect based JPEG Request Header

The first four bytes of the autodetect based JPEG request header consist of a static magic number, that is always set to the values given in the table below. The sequence number given in the request is returned in the reply, so that replies can be matched to the respective request.

16		32	
0x4b 1 Byte	0xa5 1 Byte	0xc3 1 Byte	0x55 1 Byte
Sequence Number 4 Bytes			
0x00 1 Byte	0x00 1 Byte	Reply Port 2 Bytes	
8		24	

Sequence Number

This sequence number must be a randomized number.

Reply Port

Specifies the reply UDP port e.g. RP1 0x06; RP2 0xDE -> reply port: 1758

MAC list scan extension

The autodetect based JPEG request can only be targeted at selected devices. To announce the scope of the request, extending the request packet by a MAC list scan extension, like it is defined in the chapter "Autodetecting Devices" of this document, is obligatory. As the intended use of this JPEG retrieval mechanism is limited to situations where the regular JPEG retrieval mechanisms (HTTP request for the JPEG, RCP request of CONF_JPEG within a regular RCP+ client session, etc.) do not work, the MAC list of the scan extension is limited to 1 MAC address, i.e. only one JPEG from one device can be retrieved at a time.

Format of the reply packet to an autodetect based JPEG request

The reply packet to the request for an autodetect based broadcast JPEG consists of an RCP plus protocol header and an autodetect based JPEG request header, followed by the JPEG data.

RCP plus protocol header

The RCP plus protocol header's command id field is set to 0x099e (CONF_JPEG). The data type field is set to 0x0c (P_OCTET). The numeric descriptor field identifies the line of the targeted device, from which the JPEG was retrieved. The length field of the reply indicates the number of payload bytes and therefore is to be set to the length of the autodetect based JPEG request header plus the length of the JPEG thumbnail.

Autodetect based JPEG Request Header

The autodetect based JPEG request header in the reply is byte for byte a copy of the same header in the respective request.

JPEG thumbnail

The JPEG thumbnail data follows the autodetect based JPEG request header.

Setting an IP Address using Broadcast Mechanism

If the current IP address of a device doesn't match the subnet settings, this unit cannot be reached using the standard Remote Control Protocol. All IP parameters of a VideoJet can be set using a UDP broadcast message to port **1759**.
This is supported for IPv4 broadcast **255.255.255.255**
And also for IPv6 multicast to (link-scope all-hosts multicast) **ff02::1**

Payload Structure (Basic Version IPv4 only)

16		32	
Hardware Address			
6 Bytes ...			
	Reserved		
	2 Bytes (shold be zero)		
IP Address			
4 Bytes			
Subnet Mask			
4 Bytes			
Gateway IP			
4 Bytes			
Reserved			
4 Bytes			
8		24	

Hardware Address

MAC address of the device.

IP Address

IP address to set.

Subnet Mask

Subnet mask to set.

Gateway IP

Gateway IP address to set.
As all VideoJets will receive this message, only the unit matching the hardware address (HW1-HW6) will update its IP parameters.

NOTE: There will be no reply to this command.

NOTE: This command will only work if NO service password is set.

Payload Structure (Extended Version IPv4 and IPv6 settings)

16		32	
Hardware Address 6 Bytes ...			
	Version 1 Byte	Ipv6 PrefixLen 1 Byte	
IPv4 Address 4 Bytes			
IPv4 Subnet Mask 4 Bytes			
Gateway IPv4 Address 4 Bytes			
IPv6AddrString 64 Bytes			
IPv6GatewayAddrString 64 Bytes			
8		24	

Hardware Address

MAC address of the device.

Version

Version of this command (must be 2)

Ipv6 PrefixLen

IPv6 Prefix length used for the IPv6 Device Address

IPv4 Address

IPv4 Address to set.

IPv4 Subnet Mask

Subnet mask to set.

Gateway IPv4

Gateway IPv4 address to set.

IPv6AddrString

Zero terminated string containig the IPv6 address to set.

Format: e.g. FD00::1234:5678

IPv6GatewayAddrString

Zero terminated string containig the IPv6 gateway address to set.

Format: e.g. FD00::1234:5678

As all VideoJets will receive this message, only the unit matching the hardware address (HW1-HW6) will update its IP parameters.

NOTE: There will be no reply to this command.

NOTE: This command will only work if NO service password is set.

Request or setting of system or network parameters using Broadcast Mechanism

In addition to the SETTING_AN_IP_ADDRESS_USING_BROADCAST, an additional way to setup non network configured devices has been introduced. The device itself is selected using the ethernet mac address as the first parameter inside the command structure. A list of commands including payload length information may be added. All commands must be addressed using UDP broadcast message to port **1760**.

Payload Structure

MAC address 6 Bytes ...		
Reserved 2 Byte	Command ID 2 Byte	
Payload length 2 Byte	Variable length payload	
	n Bytes	

MAC address

MAC address of the unit to configure

Command ID

ID of broadcast setting command

LED_BLINK = 0x0000

Payload length 4 bytes. Requests the unit blink the power led; payload containin the number of seconds for blinking. NOTE duration is limited to 60 sec.

SWITCH DHCP = 0x0001

Payload length 4 bytes. Switches DHCP on (payload = 1) or off (payload=0).

NOTE: This command will only work if NO service password is set.

Payload length

Length of the payload section

Variable length payload

Payload; depending on Command ID

NOTE: There will be no reply to this command.

Extension for RCP+ commands containing IPv6 addresses or host names

For transmitting IPv6 addresses or host names in RCP+ Commands there is a string table extension in firmware version 5.50 and later. The layout of the RCP+ commands remains the same as it was in earlier firmware versions and it is compatible to older clients as long as only IPv4 Addresses are transmitted. If IPv6 Addresses are contained in the command then this extension has to be used.

RCP+ Command with string table

RCP Header
RCP Data
String Table Header
String Table Entry 1
String Table Entry 2
...
String Table Entry n

String Table Header

TableLenBytes 4 Bytes		
Version 1 Byte	Reserved 1 Byte	NumEntries 2 Bytes

TableLenBytes

Length of hole string table including this header.

Version

Must be 1.

Reserved

Must be 0.

NumEntries

Number of entries in the table.

String Table Entry

LenBytes 2 Bytes	Datatype 1 Byte	Reseved 1 Byte
Data Variable lenght		

LenBytes

Length of this entry including this header.

Datatype

Type of content:

- 0 = IPv4 binary encoded value (always 4 bytes)
- 1 = IPv6 binary encoded value (always 16 bytes)
- 2 = HostName or IPv4/IPv6 Address String (encoded as zero terminated string)

Reseved

Must be 0.

Data

n bytes of entry data.

Rules for using the table

- The "StringTable" extension is an option.
- If the RCP-Data contain any IP-Address which current(!) value is other than an IPv4 type then the StringTable option must be used.
- If the RCP-Data does not contain any IP-Address which current(!) value is other than an IPv4 type then the StringTable option should NOT be used to be compatible with older firmware versions and with commands which

might not (yet) support this feature.

- If the StringTable is used then:

1. The string_table_avail flag must be set to 1 in the RCP+ Header
2. All IP-values within "RCP-Data" must be stored in the string table (also when they are IPv4 values)
3. The DWORD-field in "RCP-Data" (which normally would store the IPv4 value) has to contain an offset-pointer to the location in the string table where the actual IP-Address-value can be found.
Offset has to be calculated from "Head of StringTable Header" to "Head of StringTable Entry Header" in Bytes.
4. There is only one StringTable allowed in an RCP+ Packet.
5. The len field of the RCP+ Header must NOT include the size of the StringTable.
6. The len field of the TPKT Header (Framing Header) MUST include the size of the StringTable.
(This means: RCP-Packet and StringTable are both content of the same TPKT Packet)

RCP Command Notification

A RCP client can register for a special message CONF_RCP_CMD_NOTIFICATION (0xff23) in order to be informed when any other RCP+ command is written to the device.

The message is sent out at a frequency of maxium 100ms and contains the tag codes of all RCP+ commands with the direction 'write' that have been processed by the device since the last message. If no RCP+ command was written within this time, no message will be sent. Besides the tag codes the message contains some more information about the commands as described below.

The payload of the message contains one or multiple elements of the following structure (one element for each RCP command). The maxium number of elements is 32.

Message payload element

16		32	
Command Tag 2 Bytes		Datatype 1 Byte	Direction 1 Byte
Action 1 Byte	Reserved 1 Byte	Client ID 2 Bytes	
Reserved 4 Bytes			
NumDes 2 Bytes		Count 2 Bytes	
8		24	

Command Tag

Tag code of the RCP command.

Datatype

Datatype of the RCP command (e.g. P_OCTET).

Direction

Direction of the RCP command (currently only WRITE).

Action

Action of the RCP command (currently only REPLY).

Client ID

Client Id of the RCP client that sent the RCP command.

NumDes

Numeric Descriptor (NumDes) parameter value of the RCP command.

Count

Number of times that this RCP command has been processed.

CONF_RCP_CLIENT_REGISTRATION

Tag code 0xff00		NumDes no	Message no	SNMP Support no
Datatype %		Access Level unprotected	Description %	
Read				
Write	p_octet	unprotected	see detailed description	

The registration is a standard RCP packet with the command code 0xFF00 with data type P_OCTET (0x0c). The Numeric Descriptor is not used. The Client ID in the header section is ignored.

Payload Structure

Payload Structure

RegType 1 Byte	Reserved 1 Byte	Client ID 2 Byte	
PE 1 Byte	PL 1 Byte	Nbr 2 Byte	
Tag 1 2 Byte		N x 2 Bytes	Tag N 2 Byte ...
	Char 1 1 Byte	N x 1 Byte	Char N 1 Byte

RegType

Values:

Modify Registration	0x00
Normal Registration	0x01
Hook Back Registration	0x03

Client ID

Unused

PE

Password and User Delivery Encryption.

Values:

Plain text	0x00
MD5 hash	0x01

PL

Password and User String Length. Number of bytes to follow for the password string.

Nbr

Number of message tags inside this packet.

Tag 1 - N

Tag codes for the messages which should be passed to the RCP client (see tag code table for capability to generate messages) – A Tag code of 0xFFFF will force the VideoJet to generate a message on all possible events.

Char 1 - N

Password string itself. NOTE: No \0 termination!

Registration Procedure

Normal Registration

1. The client opens up a TCP connection to the VideoJet.
2. The client sends an RCP registration as mentioned above.
3. The RCP server (the VideoJet) will respond with the result code and the assigned Client ID.
4. The client is now allowed to send RCP Requests provided with the Client ID.

Modify Registration

An already registered client can change the message list.

Hook Back Registration

This mechanism is used during connection establishment only. A called host is requested to do a back register to the calling host. To achieve proper client allocation on the calling host, the Client ID of the server session on the called host must be provided in the 'Hook back' registration.

Format: XXXX@PasswordString

XXXX:	The Client ID in hexadecimal notation (4 digits)
PasswordString:	as defined below

Password and User Delivery and Encryption

There are currently three user levels on the videojet:

- live – For video access only; no control
- user – For video access and control over the video stream (e.g. caminput)
- service - for video and all administrative access

Plain text:

The identification string must have the following format: +Username:Password+

MD5 hash encryption:

1. A 16 character random string for MD5 hash calculation must be requested from the VideoJet (RCP command CONF_RCP_REG_MD5_RANDOM).
2. A string +random_string+++username:password+ must be formed.
3. The response MD5 hash over this string must be calculated.
4. The identification string in the register packet must have the following format: +Username:random_string:response_string+

NOTE: No additional whitespaces are allowed.

Server Reply

1632		
Result	Level	Client ID
1 Byte	1 Byte	2 Bytes
8	24	

Result

Values:		
Registration failed	0x00	
Registration successful	0x01	

Level

The level after this registration.

Client ID

Identification number under which the client is now registered at the VideoJet.

CONF_RCP_CLIENT_REGISTRATION_V2

Tag code	NumDes	Message	SNMP Support
0xFF04	no	no	no
Datatype	Access Level	Description	
Read	%	unprotected	%
Write	p_octet	unprotected	see detailed description

The registration is a standard RCP packet with the command code 0xFF04 with data type P_OCTET (0x0c). The Numeric Descriptor is not used. The Client ID in the header section is ignored. The difference to CONF_RCP_CLIENT_REGISTRATION is that this command support extra flags.

Payload Structure

Payload Structure

RegType 1 Byte	Flags 1 Byte	Client ID 2 Byte	
PE 1 Byte	PL 1 Byte	Nbr 2 Byte	
Tag 1 2 Byte		N x 2 Bytes	Tag N 2 Byte ...
	Char 1 1 Byte	N x 1 Byte	Char N 1 Byte

RegType

Values:

Modify Registration	0x00
Normal Registration	0x01
Hook Back Registration	0x03

Flags

Values:

MESSAGES_IN_V2_FORMAT. Register for messages with extended timestamp and sequence number header. If this flag is set, then all messages sent from the server to this client have an additional timestamp and sequence number header right after the RCP+ Header. This header is identical to the "Timestamp Header Structure" returned by CONF_RCP_MSG_V2_HISTORY. Please see description of CONF_RCP_MSG_V2_HISTORY for details.	0x02
TAGGED_OPTION_HDR. (Signal that the client will send extra tagged option list on each request. Internal only)	0x04

Client ID

Unused

PE

Password and User Delivery Encryption.

Values:

Plain text	0x00
MD5 hash	0x01

PL

Password and User String Length. Number of bytes to follow for the password string.

Nbr

Number of message tags inside this packet.

Tag 1 - N

Tag codes for the messages which should be passed to the RCP client (see tag code table for capability to generate messages) – A Tag code of 0xFFFF will force the VideoJet to generate a message on all possible events.

Char 1 - N

Password string itself. NOTE: No \0 termination!

Registration Procedure

Normal Registration

1. The client opens up a TCP connection to the VideoJet.
2. The client sends an RCP registration as mentioned above.
3. The RCP server (the VideoJet) will respond with the result code and the assigned Client ID.
4. The client is now allowed to send RCP Requests provided with the Client ID.

Modify Registration

An already registered client can change the message list.

Hook Back Registration

This mechanism is used during connection establishment only. A called host is requested to do a back register to the calling host. To achieve proper client allocation on the calling host, the Client ID of the server session on the called host must be provided in the 'Hook back' registration.

Format: XXXX@PasswordString

XXXX:

PasswordString:

The Client ID in hexadecimal notation (4 digits)
as defined below

Password and User Delivery and Encryption

There are currently three user levels on the videojet:

- live – For video access only; no control
- user – For video access and control over the video stream (e.g. caminput)
- service - for video and all administrative access

Plain text:

The identification string must have the following format: +Username:Password+

MD5 hash encryption:

1. A 16 character random string for MD5 hash calculation must be requested from the VideoJet (RCP command CONF_RCP_REG_MD5_RANDOM).
2. A string +random_string+++username:password+ must be formed.
3. The response MD5 hash over this string must be calculated.
4. The identification string in the register packet must have the following format:
+Username:random_string:response_string+

NOTE: No additional whitespaces are allowed.

Values:

Registration failed

Registration successful

0x00

0x01

Level

The level after this registration.

Client ID

Identification number under which the client is now registered at the VideoJet.

CONF_RCP_CLIENT_UNREGISTER

Tag code	NumDes	Message	SNMP Support
0xff01	no	no	no
Datatype	Access Level	Description	
Read	%	unprotected	%
Write	p_octet	unprotected	see detailed description

Request

The unregister is a standard RCP packet with the command code **0xFF01** with no payload section. The needed information (Client ID) will be taken from the header section.

Reply

The reply will have the following format:

	16	32
Result	Level	Client ID
1 Byte	1 Byte	2 Bytes
8	24	

Result

Values:

Unregister failed	0x00
Unregister successful	0x01

Level

The level before this unregister.

Client ID

Identification number under which the client was registered at the VideoJet.

NOTE: This command is NOT readable.

CONF_RCP_CLIENT_TIMEOUT_WARNING

Tag code		NumDes	Message	SNMP Support
0xff03		no	yes	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	not supported; will generate message if client idle timeout will happen in 1 minute	
Write	f_flag	access_right_minimal	not supported; will generate message if client idle timeout will happen in 1 minute. see detailed description	

Timeout handling

The RCP server has to deal with lots of RCP connections at the same time. If an RCP client is going down without notification to the server, an orphan table entry will remain. To avoid this, a timeout mechanism is provided. Each RCP client must show any activity within 10 minutes. After this time the registration of a specific RCP client is invalid. For easy handling, the RCP client can register itself for an RCP_CLIENT_TIMEOUT_WARNIG message. The client will be notified 1 minute before the timeout occurs.

The timeout renewal can be achieved by any RCP read or write command. A good advise is to read the RCP_CLIENT_REGISTRATION.

CONF_RCP_REG_MD5_RANDOM

Tag	code	NumDes	Message	SNMP	Support
	0xff05	no	no		no
Datatype		Access Level	Description		
Read	p_string	unprotected	returns a 16 char. random string to be used in MD5 hash encrypted registration. see detailed description		
Write	%	unprotected	%		

NOTE: To avoid 'denial of service' attacks, the RCP server will only grant up to 5 random strings at the same time. Maximum time from the request of a random string to its use: 5 seconds. Multiple requests from the same host are ignored.

CONF_RCP_TRANSFER_TRANSPARENT_DATA

Tag code	NumDes	Message	SNMP Support
0xffdd	yes	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_live	see detailed description
Write	p_octet	access_right_user	see detailed description

The transparent data from and to the serial interfaces is handled by the RCP to achieve reliable transfer of information. To gather control over the remote serial interface a successful registration is necessary.

Request packet

Options 1 Byte	Reserved 1 Byte	Lease Time 2 Bytes
Trans. Data 1 1 Byte	N x 1 Byte	Trans. Data N 1 Byte

Options

Currently no options used

Lease Time

Time in seconds the lease is requested

Values:

Only this packet should be sent out; no further control is requested	0x0000
Indefinite lease time; request lease as long as the current registration is valid	0xFFFF

NOTE: The lease time should be treated as a request; the VideoJet may switch leases before the requested time is over due to a higher prioritized RCP client

For this direction, an RCP Write command to a specific port (addressed by the Numeric Descriptor) is necessary. Once the VideoJet has received a TRANSFER_TRANSPARENT_DATA command, it checks whether the RCP client is in control or not. If the RCP client is allowed to send data to the serial interface, the reply will present an OK. If the RCP client is not allowed to send data, a FAIL will be returned. In this case another RCP client is controlling the serial out. The timeout and priority handling of the serial ports is beyond the scope of this document.

NOTE: This command is NOT readable.

Write reply packet

Code

Values:

Access to the serial port denied	0x00
Access to the serial port granted	0x01

Reading the TRANSFER_TRANSPARENT_DATA command

The reply to the Read command will be the same as the reply to the write command. The returned code will present the availability of the serial port.

NOTE: Despite a positive reply to a read command, the port may be locked by another RCP client in the time slice between the read and a following write command.

Serial IN -> RCP Client

The data coming from the serial input is delivered using an RCP message. All RCP clients which want to receive this data must be registered for the message 0xFFDD. Data is posted if the corresponding RCP client is in control only.

If no client has a lease on the serial port, a message to all registered clients will be generated.

NOTE: The received message will carry NO header.

CONF_CONNECT_PRIMITIVE

	Tag code	NumDes	Message	SNMP Support
	0xff0c	no	no	no
	Datatype	Access Level	Description	
Read	%	access_right_live	%	
Write	p_octet	access_right_live	see detailed description	

Switching Media Channels

Each RCP client may have different media sources and media receivers. To connect these media channels, a low level connect/disconnect primitive is implemented. These low level primitives can be grouped together to more complex commands, which can connect more than one media channel at the same time.

The primitives are designed to be asserted by media sources or receivers itself. Manager software should use the high level commands (see next chapter).

Using GET

By sending a **CONNECT GET** to the remote endpoint, this endpoint will start sending media to the requested address. For example, a VideoJet receiver is registered at a VideoJet transmitter. On sending a **'CONNECT GET video to port 1234'** to the transmitter, the transmitter starts to send video to the appropriate port at the receiver.

The endpoint requesting the media stream (the VideoJet receiver) must be prepared to receive the stream from the network.

The coding bits for video must be set according to the receivers capability to decode the data stream. E.g. a Decoder capable of decoding MPEG2 and MPEG4 should set all these bits.

Using PUT

By sending a `CONNECT PUT` to the remote endpoint, the endpoint will prepare itself for receiving data from the one initiating the request. For example, a VideoJet transmitter is registered at a VideoJet receiver. On sending a `'CONNECT PUT video to port 2222'` to the receiver, the receiver will prepare its network stack to receive data from the appropriate port.

The endpoint initiating the media stream (the VideoJet transmitter) must start sending the media stream to the network.

The coding bits for video must be set to a value suitable to the current encoding parameters inside the VideoJet. E.g. if a video encoder is set to encode MPEG4, only a PUT request having these bits set is accepted.

The `coder` parameter is used to address a specific encoder/decoder inside the VideoJet. As the VideoJet may have a Dual-stream feature, one physical line input might be connected to more than one encoder. By setting a `coder` to another value than 0, the VideoJet only tries this specific `coder` to establish a connection. When the `coder` value is set to 0, all `coders` inside the system will be checked.

Each connect primitive will result in a Session ID for maintaining and controlling the media stream with other RCP commands. The Session ID can be treated as unique on the entire system.

DISCONNECT

By sending a DISCONNECT supplied with a valid Session ID, the receiver of the command will stop sending/receiving to/from the media stream. The endpoint initiating the DISCONNECT command must stop receiving/sending from/to the media stream.

Request Packet

Sequence of:

Method 1 Byte	Media 1 Byte	Reserved 1 Byte	Flags 1 Byte
Reserved 4 Bytes			
Media Descriptor 1 M Bytes (Length depends on Media type)			
N x M Bytes	Media Descriptor N M Bytes ...		

Method

Values:

GET	0x00
PUT	0x01
Key transport	0xE0

Media

Values:

Video	0x01
Audio	0x02

Data

0x03

Flags

Bit1: Do reverse Login. This will control whether the called server will perform a reverse RCP Login.

Bit2: Free Running Connection. When this bit is set, the connection does not need to be re-triggered by the command CONF_RCP_CONNECTIONS_ALIVE.

Bit3: Optional signalling for streaming (for correct connection list display)

Bit4: Media key request (when using GET) / Media key is appended at the end of this section (when using PUT)

Bit5: Dry Connect. If this bit is set a replay connection is established (and a session id to control the replay connection is returned). The replay source is not connected. This can be done using the CONF_RCP_CONNECT_SALVO command

Bit6: Transcoder: Set this bit to instantiate and establish a connection to the transcoder

Bit7: Media over ssl: This Bit is set in the response to signal that the device supports "media over ssl".

Bit8: Multi ROI capable: This Bit signals that a client is able to provide a session ID to steer multiple ROIs (region of interest) with E-PTZ.

8		24	

MEP

Media Encapsulation Protocol.

Values:

API Callback 0x06

Media Handle

Identifier that is associated with the rtp data and is supplied with the rtp data in the callback function.

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES)

Coder

Specifies the internal coder number; when set to 0, the appropriate coder corresponding to the given line number and/or coding parameter is chosen by the VideoJet itself.

Line

Identifies the Line Input/Output channel for the specified coding engine.

Target Idx

The index of the target on the iSCSI Server. This index can be obtained by sending a discover to the server.

Lun Idx

The index of the Lun of the specified target on the iscsi server.

Span Idx

The index of the span.

Coding

ISCSI_ERROR_LOGIN 0x34
ISCSI_ERROR_INV_TRG_IDX 0x35

Key transport

When the media key bit is selected in the header flags, a variable length key field is appended at the end of the media descriptor. The key field has the following structure

Sequence of:

16		32	
method 1 Byte	bytes valid 1 Byte	status tag 1 Byte	reserved 1 Byte
key data 4 Bytes			
8		24	

method

must be set to 'Key transport' 0xE0

bytes valid

the number of valid key bytes in this header

status tag

must be set to 'Key transport tag' 0xE0

key data

the key payload

The media key is transferred using a sequence of key headers all with the method field set to 0xE0. The end of the key section is marked by a header with less than 4 bytes (or zero) indicated in the bytes valid field.

The typical key length is 16 bytes (128 bit AES). In this case, four full key headers followed by one empty header must be transferred (4 x 4 bytes valid + 1 x 0 bytes valid = 16 bytes)

For backward compatibility, the header method 0xE0 will be skipped by units with former firmwares versions.

The key is located and stored on each media source (using the CONF_CRYPT_KEY* commands); When the system is configured to publish its keys (see CONF_PUBLISH_MEDIA_KEYS), then the media sources must fill in the secret by sending (PUT method) or replying to (GET method) the connect primitive.

For example, when sending a GET connect primitive to a device and the key transport is selected, then the device will fill in its key in the reply to the connect primitive.

NOTE: be sure to use a secure RCP connection, the keys in the connect primitive are tranferred in plain

1 Byte	1 Byte	2 Bytes
Local Coder	Local Line	Put Channels
1 Byte	1 Byte	2 Bytes
Remote Coder	Remote Line	Get Channels
1 Byte	1 Byte	2 Bytes
8	24	

Destination IP Address

The reception of this command will force the host to connect to the mentioned destination IP address.

Line

OBsolete
This parameter carries the number of the remote input (for get channels) or the local input (for put channels); For connection to the HDD, the Line byte must carry the partition number of the HD.
This parameter is updated by the local line/coder and remote line/coder settings.

Flags

NOTE: Only one video standard (MPEG2/4) can be used; setting all bits will result in best currently available mode.

Values:	
Bit0	Substitute an existing connection
Bit1	Request video mode MPEG-4
Bit2	Request video mode MPEG-2
Bit3	Force the use of TCP as transportation protocol
Bit4	Connect to the HDD to receive a recorded media stream
Bit6	Connect a VCA meta data stream
Bit7	Supress automatic media key exchange
Bit8	Use SSL for the RCP control connection; if no destination port is specified, the remote port defaults to 443 (HTTPS) in case of SSL is requested otherwise 80(HTTP)
Bit9	Request video mode H.264
Bit10	Request video mode JPEG
Bit11	Allow audio mode L16 (setting this bit to 0 uses G711 (default, previous behaviour), setting to 1 allows G.711 and L16 - both with 90kHz timestamp clock)
Bit12	Allow audio mode AAC
Bit13	Request video mode H.265

Local Coder

This parameter carries the number of the local coder number. A wildcard of '0' will result in first match.

Local Line

This parameter carries the number of the local video line number. A wildcard of '0' will result in first match.

Put Channels

Values:

Bit0	Video
Bit1	Audio
Bit2	Data
Bit3-Bit15	Reserved

Remote Coder

This parameter carries the number of the remote coder number (at the destination IP). A wildcard of '0' will result in first match.

Remote Line

This parameter carries the number of the remote video line number (at the destination IP). A wildcard of '0' will result in first match.

Get Channels

Values:

Bit0	Video
Bit1	Audio
Bit2	Data
Bit3-Bit15	Reserved

NOTE: For audio connections, the local and remote line parameter are taken from the video settings.

If this command is extended with the optional appendix, the remote port number for RCP login must be specified. This can be either 1756 for the normal RCP port or any available HTTP port at the remote host. When a port number different to 1756 is used, the login will use a HTTP tunnelling.

Optional Appendix

16		32	
Dest. Port 2 Bytes	Flags 2 Bytes		
Reserved 2 Bytes	remote password level 1 Byte	remote password length 1 Byte	
remote password 128 Bytes			
8		24	

Dest. Port

This parameter carries the number of the remote TCP port number used for RCP login.

Flags

Values:

Bit0 remote password field is url (supports urls like rtsp://user:pw@160.10.9.222:5540/rtsp_tunnel)

remote password level

remote user: password level: 1-user, 2-service, 3-live, 0-no protection (optional parameter)

remote password length

remote user: password length (optional parameter)

remote password

remote user: password (optional parameter)

Reply / Read / Message

The reply to this command will present the same packet format as the outgoing. The result will contain the really established channels.

A message will be generated if all requested channels are established; if a channel fails, the appropriate bit will be cleared in the channel section.

CONF_ACTIVE_CONNECTION_LIST

Size of the section including SectionType, Size and NbElement. If the section is unknown, you can skip to the next using the size

NbElement

determines how many Elements are following. The definition of each Element depends on the type of the section

Element Structure

For section type Video

Type 2 Bytes	Identifier 2 Bytes	Compr 2 Bytes	InputNo 2 Bytes	Resolution 2 Bytes
-----------------	-----------------------	------------------	--------------------	-----------------------

Type

is one of the following

Values:

VIDEO_ENCODER	0x0001
VIDEO_DECODER	0x0002
VIDEO_TRANSCODER	0x0003

Identifier

Identifier is the RCP numeric descriptor to use to address the entity. It should be unique when associated with the type and the compression. In case of transcoders this numeric descriptor is informative only. It is not necessary to address the entity directly (use the relevant rcp commands instead).

Compression

is one or multiple of the following

Values:

VIDEO_COMP_MPEG2	0x0001
VIDEO_COMP_MPEG4	0x0002
VIDEO_COMP_H264	0x0004
VIDEO_COMP_JPEG	0x0008
VIDEO_COMP_H265	0x0010

Notice: please use CONF_CODER_VIDEO_OPERATION_MODE to configure the video standard. The dependencys are explained in detail at CONF_CODER_VIDEO_OPERATION_MODE.

InputNo

InputNo is the number of the physical input from which the entity gets or puts its video. In case of transcoder this value is unused and set to 0;

Resolution

is one or multiple of the following

<u>Values:</u>		
VIDEO_RESO_QCIF		0x0001
VIDEO_RESO_CIF		0x0002

CONF_PUBLISH_MEDIA_KEYS

Tag code		NumDes	Message	SNMP Support
0x09fc		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	switches wheather the media key of a media source are readable and transferred during the hw-hw connection setup	
Write	f_flag	access_right_service	switches wheather the media key of a media source are readable and transferred during the hw-hw connection setup	

CONF_CRYPT_KEYAUDIO_ENC

Tag code	NumDes	Message	SNMP Support
0x09fe	coder instance	no	no
Datatype Access Level Description			
Read	p_octet	access_right_service	get key for AES Audio data encryption/decryption
Write	p_octet	access_right_service	set key for AES encryption/decryption of audio data see detailed description

Payload Structure

Key

The 16 Byte Masterkey for AES encryption/decryption of data

Comments:

- This description is valid for the the commands:
CONF_CRYPT_KEYVIDEO_ENC,
CONF_CRYPT_KEYVIDEO_DEC,
CONF_CRYPT_KEYAUDIO_ENC,
CONF_CRYPT_KEYAUDIO_DEC
- The numeric descriptor contains the number of the coder instance (absolute)
- Set all Key- and all Salt- Bytes to zero, if no encryption/decryption is wished.

CONF_CRYPT_KEYVIDEO_ENC

Tag code		NumDes	Message	SNMP Support
0x09ed		coder instance	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	get key for AES Video dataencryption/decryption	
Write	p_octet	access_right_service	set key for AES encryption/decryption of video data see detailed description	

Payload Structure

Key

The 16 Byte Masterkey for AES encryption/decryption of data

Comments:

- This description is valid for the the commands:
CONF_CRYPT_KEYVIDEO_ENC,
CONF_CRYPT_KEYVIDEO_DEC,
CONF_CRYPT_KEYAUDIO_ENC,
CONF_CRYPT_KEYAUDIO_DEC
- The numeric descriptor contains the number of the coder instance (absolute)
- Set all Key- and all Salt- Bytes to zero, if no encryption/decryption is wished.

CONF_CRYPT_KEYAUDIO_DEC

Tag code		NumDes	Message	SNMP Support
0x09ff		coder instance	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	get key for AES Audio data encryption/decryption	
Write	p_octet	access_right_service	set key for AES encryption/decryption of audio data see detailed description	

Payload Structure

Key

The 16 Byte Masterkey for AES encryption/decryption of data

Comments:

- This description is valid for the the commands:
CONF_CRYPT_KEYVIDEO_ENC,
CONF_CRYPT_KEYVIDEO_DEC,
CONF_CRYPT_KEYAUDIO_ENC,
CONF_CRYPT_KEYAUDIO_DEC
- The numeric descriptor contains the number of the coder instance (absolute)
- Set all Key- and all Salt- Bytes to zero, if no encryption/decryption is wished.

CONF_CRYPT_KEYVIDEO_DEC

Tag code		NumDes	Message	SNMP Support
0x0a00		coder instance	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	get key for AES Video dataencryption/decryption	
Write	p_octet	access_right_service	set key for AES encryption/decryption of video data see detailed description	

Payload Structure

Key

The 16 Byte Masterkey for AES encryption/decryption of data

Comments:

- This description is valid for the the commands:
CONF_CRYPT_KEYVIDEO_ENC,
CONF_CRYPT_KEYVIDEO_DEC,
CONF_CRYPT_KEYAUDIO_ENC,
CONF_CRYPT_KEYAUDIO_DEC
- The numeric descriptor contains the number of the coder instance (absolute)
- Set all Key- and all Salt- Bytes to zero, if no encryption/decryption is wished.

CONF_CRYPT_KEY_GENERATE_ALL

Tag code		NumDes	Message	SNMP Support
0x0a13		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	returns flag=0 when all key are cleared otherwise flag=1	
Write	f_flag	access_right_service	generates a random key(flag=1) or clears all(flag=0) keys for AES encryption for all media encoders	

CONF_RCP_MSG_V2_HISTORY

Tag code	NumDes	Message	SNMP Support
0x0c57	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	read the list of RCPv2 Event-Messages pending in device history buffer, see detailed description
Write	p_octet	access_right_service	write not supported

Payload structure of request mode 0

Mode

Select the mode to read messages indicated by a initial sequence number.

Values:

Read by sequence number 0x0

MaxResultMsg

Maximum number of result messages to be returned by one execution of this command

Values:

MsgSeqNo

The first returned message will be the next in device buffer after those indicated by this number. e.g. if MsgSeqNo is 7, then first result is 8 or even a higher number if there is no message 8 according to filters in this data path. If value 0 is supplied then the result starts with the oldest message which is still available on the device. To perform a chunked read the last MsgSeqNo returned by prior request to this command can be the argument of the next request to retrieve the next chunk.

Values:

BootCount

Boot counter. This in combination with MsgSeqNo makes a unique ID for a message. If supplied BootCount is lower than actual BootCount then all messages in Buffer are returned up to MaxResultMsg

Values:

Payload structure of request mode 1

Mode

Select the mode to read messages indicated by by relative timestamp

Values:

Read by relative time 0x1

MaxResultMsg

Maximum number of result messages to be returned by one execution of this command

Values:

LastNumSeconds

The first returned message will be those indicated by this number of seconds back in the past. E.g. value of 30 will start returning the oldest messages which was triggered 30 seconds ago, and then continue with all subsequent up to MaxResultMsg.

Values:

Result Payload

Result Payload Structure

The result payload consists of a repeated sequence for each returned message. A RCP-Plus header, a Timestamp Header, and then the usual RCP-Message payload.

Timestamp Header Structure

16		32	
MsgSeqNo 4 Bytes			
SecSince2000 4 Bytes			
Milliseconds 2 Byte	BootCount 2 Byte		
SkippedSeqNo 2 Byte	Timezone 1 Byte	Reserved 1 Byte	
8		24	

MsgSeqNo

Message counter starts with 0 on each bootup

Values:

SecSince2000

Time in seconds from RTC in UTC

Values:

Milliseconds

Millisecond extension to SecSince2000

Values:

BootCount

Number of reboots. Use in combination with MsgSeqNo to get a unique Message-ID

Values:

SkippedSeqNo

Number of skipped sequence numbers in this stream due to registering/filtering rules

Values:

Timezone

Timezone in 15 minute steps. Negative values have the leading bit 7 set.
e.g. 0x03 = +45 minutes; 0x84 = -60 minutes

Values:

Reserved

Should be ignored

Values:

CONF_RCP_CONNECT_SALVO

Tag code	NumDes	Message	SNMP Support
0xff13	yes (0 - nothing, 1 to 4 referring to entries of CONF_ADD_REMOTE_DEVICE)	no	no
Datatype	Access Level	Description	
Read	%	access_right_live	%
Write	p_octet	access_right_live	see detailed description

Payload Structure

flags 8 Bits	line 8 Bits	dec inst 8 Bits	relative coder 8 Bits
port 16 Bits		ssl port 16 Bits	
vrn track id 16 Bits		reserved 2 Bytes	
url len 16 Bits		url ...	
url (url len) bytes ...			
pwd len 16 Bits		pwd ...	
pwd (pwd len) bytes...			

flags

bit 0: live video, bit 1: use TCP to get live video, bit 2: internal used, bit 3: replay live only, bit 4: internal used, bit 5: internal used, bit 6: delete cam connected to dec inst (multi view only),

line

line from 1 to max lines (line 0 is mapped to line 1)

dec inst

dec inst from 1 to max ... (dec inst 0 means any) for multiview capable de/transcoders

relative coder

relative coder number from 1 to ... (coder number 0 is mapped to coder number 1)

port

port

ssl port

ssl port

vrn track id

track ID (VRM case)

url len

length of the following url (actual limit is 64)

url

url for the connection salvo, ascii string including zero termination, if the special url starting with "trackid://" is used, the following decimal value is the VRM Track ID (e.g. "tackid://15096")

pwd len

length of the following password (actual limit is 64)

pwd

password for the salvo connection, ascii string including zero termination

CONF_RCP_CONNECT_SALVO

A replay connection can be established in two steps: 1) build up a "dry" (replay) connection by setting the flag in the CONNECT_PRIMITIVE request. A Rcp connection is established and a session id to control the connection is returned. Data is not sent out as long as no source is connected. 2) connect a source to the connection (only implemented for replay) using this RCP_CONNECT_SALVO_COMMAND with the provided session id. The connection will retrieve the data from the specified device If a source is already connected a second call of this command will replace the first connection. The num parameter can be used to refere to an entry from CONF_ADD_REMOTE_DEVICE (num 1 to 4). In that case only a shorter payload (line and relative coder) is required. All other parameters will be taken from the CONF_ADD_REMOTE_DEVICE command. For port and ssl port the first two ports of a CONF_ADD_REMOTE_DEVICE entry will be used in that order. If the num parameter is set to zero, all other parameters are required and used if the connection is a remote device. If num is zero and the short payload (line and rel coder) is also used, it is asumed, that the local device

is addressed.

CONF_MUTE_MEDIA_CHANNEL

Tag code		NumDes	Message	SNMP Support
0xff14		no	no	no
Datatype		Access Level	Description	
Read	%	access_right_live	%	
Write	t_dword	access_right_live	mutes/unmutes a media channel: Bit 1: video, Bit2: audio, Bit3: meta; session id is needed, don't mute if media channel is in multicast	

CONF_STREAM_EXCLUSIVE_CHECK

Tag code	NumDes	Message	SNMP Support
0x0ba0	no - addressing via Session ID	no	no
Datatype	Access Level	Description	
Read	f_flag	access_right_minimal	check if connected ROI stream session is exclusive (meaning only one instance to one client -> exclusive ROI steering). 0: non-exclusive; 1: exclusive
Write	%	access_right_service	%

CONF_UNIT_NAME

Tag code	NumDes	Message	SNMP Support
0x0024	no	no	yes
Datatype	Access Level	Description	
Read	p_unicode	access_right_minimal	read the unit name
Write	p_unicode (max 32 unicode character)	access_right_service	set unit name

CONF_UNIT_ID

Tag code	NumDes	Message	SNMP Support
0x0025	no	no	yes
Datatype	Access Level	Description	
Read	p_unicode	access_right_minimal	read the unit ID
Write	p_unicode (max 32 unicode character)	access_right_service	set unit ID

CONF_CAMNAME

Tag code		NumDes	Message	SNMP Support
0x0019		video line	no	yes
Datatype		Access Level	Description	
Read	p_unicode	access_right_minimal	Deprecated! Use CONF_CAMNAME_LINES instead.	
Write	p_unicode (max 32 unicode characters)	access_right_service	Deprecated! Use CONF_CAMNAME_LINES instead.	

CONF_CAMNAME2

Tag code		NumDes	Message	SNMP Support
0x0a7e		video line	no	no
Datatype		Access Level	Description	
Read	p_unicode	access_right_minimal	Deprecated! Use CONF_CAMNAME_LINES instead.	
Write	p_unicode (max 32 unicode characters)	access_right_service	Deprecated! Use CONF_CAMNAME_LINES instead.	

CONF_CAMNAME_LINES

Tag code		NumDes	Message	SNMP Support
0x0bb1		video line	no	no
Datatype		Access Level	Description	
Read	p_unicode	access_right_minimal	read out camera name, use CONF_ENC_STAMPING_PROPERTIES to determine line length l (a line consists of l UTF-16 chars) and the number of supported lines n (command length = l*n (UTF-16 chars), all non used chars must be set to zero	
Write	p_unicode	access_right_service	set camera name, use CONF_ENC_STAMPING_PROPERTIES to determine line length l (a line consists of l UTF-16 chars) and the number of supported lines n (command length = l*n (UTF-16 chars), all non used chars must be set to zero	

CONF_HARDWARE_VERSION

Tag code	NumDes	Message	SNMP Support
0x002e	no	yes	yes
Datatype	Access Level	Description	
Read	p_string	unprotected	read the hardware version
Write	void	access_right_minimal	not supported

CONF_SOFTWARE_VERSION

Tag code	NumDes	Message	SNMP Support
0x002f	no	no	yes
Datatype	Access Level	Description	
Read	p_string	unprotected	read the software version
Write	void	access_right_minimal	not supported

CONF_SOFTWARE_VERSION_FORMATTED

Tag code	NumDes	Message	SNMP Support
0x0cd4	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the software version in the form ..
Write	void	access_right_minimal	not supported

CONF_BOOTLOADER_VERSION

Tag code	NumDes	Message	SNMP Support
0x09ef	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the bootloader version
Write	t_dword	access_right_minimal	not supported

CONF_FW_MIN_VERSION

Tag code	NumDes	Message	SNMP Support
0x0bab	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the required minimum firmware version. Format: (hexadecimal) 0xrVMM, where 'r' is reserved, 'VV' is the major version and 'MM' the minor version number. (E.g. 0x00000590 for version 5.90)
Write	t_dword	access_right_minimal	not supported

CONF_SERIAL_NUMBER

Tag code		NumDes	Message	SNMP Support
0x0ae7		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	returns the serial number of the device. The representation of this serial number is binary octets	
Write	%	access_right_service	%	

CONF_PRODUCT_NAME

Tag code		NumDes	Message	SNMP Support
0x0aea		no	no	no
Datatype		Access Level	Description	
Read	p_string	unprotected	Read the product name of the device. This command was previously named "CTN".	
Write	p_string	access_right_service	not supported	

CONF_COMMERCIAL_TYPE_NUMBER

Tag code		NumDes	Message	SNMP Support
0x0be7		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	Read the commercial type number (CTN) of the device. The string may be shortened or generalized as the CTN also contains parts the firmware does not know.	
Write	%	access_right_service	%	

CONF_DEVICE_TYPE_IDS

Tag code		NumDes	Message	SNMP Support
0x0b07		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read the device type ids (hexadecimal). 1st DWORD: Product ID; 2nd DWORD: Upper byte: OEM ID (BOSCH = 0), Lower 3 bytes: Variant ID; 3rd DWORD: (Bicom) Frontend Family ID	
Write	void	access_right_service	not supported	

CONF_SUPPORTED_UPLOAD_TARGETS

Tag code		NumDes	Message	SNMP Support
0x0b19		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	returns all supported upload targets for this platform (List of n DWORDs)	
Write	p_octet	access_right_service	not supported	

CONF_DEVICE_GUID

Tag code		NumDes	Message	SNMP Support
0x0b22		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read the device's GUID (32 bytes length)	
Write	p_octet	access_right_service	write the device's GUID (32 bytes length)	

CONF_DEVICE_CAPABILITIES

Tag code	NumDes	Message	SNMP Support
0x0b60	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns capabilities of the device in a tagged format
Write	p_octet	access_right_minimal	not supported

Tagged Payload Structure (T(ag) L(ength) V(alue))

num Entries
The total number of tagged entries.

length
The length of the payload. The payload of a tag must be in network byte-order.

tags
The following tags are defined:

Tag Name	Tag ID	Tag Type	Tag description
DEVICE_TYPE_TAG	1	UInt8	1=encoder, 2=camera, 3=transcoder, 4=vrn, 5=decoder, 6=streaming gateway, 8=storage, 0=other
PTZ_CAMERA_TAG	2	UInt8	ptz capabilities yes/no; This command returns ptz capabilities if the device is a dome camera, if bilinx is supported and a bilinx camera is connected to the device or if a serial dome protocol is set (0: no ptz, 1: full ptz, 2: zoom only, no pan/tilt)
ROI_CAMERA_TAG	3	UInt8	region of interest yes/no
AUTOTRACKER_TAG	4	UInt8	autotracker yes/no
NBR_VIDEO_IN_TAG	5	UInt8	number of video inputs
NBR_TRANSCODER_TAG	6	UInt8	number of transcoders
NBR_AUDIO_IN_TAG	7	UInt8	number of audio inputs
NBR_AUDIO_OUT_TAG	8	UInt8	number of audio outputs
AUDIO_OPTIONS_TAG	9	UInt8	bit0 line in, bit1 line out, bit2 mic bit3 loadspeaker (see CONF_AUDIO_OPTIONS)
EPTZ_TRACKER_TAG	10	UInt8	eptz tracker supported or not
IMAGE_PIPE_FEATURE_TAG_OLD	11	UInt32	returns 1st 4bytes of the information that is provided by bicom command 0x0520 (ServerID 4)(for backward compatibility). Use the new tag IMAGE_PIPE_FEATURES to get all features
BEST_FACE_TAG	12	UInt8	1 device supports CONF_BEST_FACE 0 device doesn't support CONF_BEST_FACE
PLATFORM_TYPE_TAG	13	UInt8	1-CPP3, 2-CPP4, 3-CPP-ENC, 4-CPP5, 5-CPP6, 6-CPP7, 7-CPP7.3, 255-OTHER
BICOM_DOME_TAG	14	UInt8	Indication if it is a dome that can be controlled using bicom (e.g via CONF_BICOM_COMMAND)
FPGA_TAG	15	UInt8	0 if no FPGA is available
VOUT_TAG	16	UInt8	camera has a vout (1: yes, 0: no)
HEATER_TAG	17	UInt8	camera has a heater (1: yes, 0: no)
SERIAL_PORT_TAG	18	UInt8	camera has a serial port (1: yes, 0: no)
NTCIP_TAG	19	UInt8	camera is ready for NTCIP use (1: yes - license is installed or NTCIP support comes pre-enabled, 0: no - license needs to be installed)
REPLAY_TAG	20	UInt32	supported replay option flags (DWORD) (0x01: span replay, 0x02: local replay, 0x04: transcoded replay)
GB28181_TAG	21	UInt8	supported of GB28181 (1 Byte) 0: no support 1: GB28181 is supported see CONF_GB28181 for further informations
FONT_SUPPORT_TAG	22	UInt32	supported utf-16 characters for Stamping; ASCII chars are always supported; Byte[0] full BoschSansCHS-Regular.ttf support (all chinese signs included in UTF-16) 0 not supported 1 supported; Byte[1-3] reserved
			record format version (DWORD, offset 0), record format version minor (WORD, offset 4), recorder version (WORD, offset

RECORDER_TAG	23	RecorderVersion	6) supported recorder mode flags (DWORD, offset 8) (0x01: standard recording, 0x02: dual recording, 0x04: buffered recording)
PTZ_ON_CLIENT_TAG	24	UInt8	0 not necessary 1: dewarping on client makes sense and all required data is provided via SEI information in the h.264 stream. Normally the case on panoramic cameras with a large view angle 180° cameras.
VIRTUAL_LINES_TAG	25	UInt8	Returns the number of virtual lines on this device or zero if there are none. If there are virtual lines, more information is available via CONF_VIRTUAL_LINES.
DPTZ_STATIC_CAPS_TAG	26	PUInt8	Signal PTZ capabilities see CONF_DPTZ_STATIC_CAPS for a detailed description of the payload
MAX_DEC_RESOLUTION_TAG	27	Resolution	max decoder/transcoder input width (DWORD, offset 0), max decoder/transcoder input height (DWORD, offset 4)
MAX_SUBVIEWS_TAG	28	UInt8	max number of video subviews
FIRE_DETECTION_TAG	29	UInt8	Fire detection available (1: yes, 0: no)
FW_UPLOAD_SIGNATURE_TAG	30	UInt8	Firmware upload signature required (1: only signed firmware accepted, 0: unsigned firmware accepted)
IMAGE_PIPE_FEATURE_TAG	31	PUInt8	returns the information that is provided by bicom command 0x0520 (ServerID 4)
CLUSTERED_DEVICE_TAG	32	UInt8	indication if the camera is clustered with other devices (1: yes, 0: no)
PIR_TAG	33	UInt8	number of PIR (passive infrared) sensors
AMBIENT_LIGHT_DETECT_TAG	34	UInt8	ambient light detection (0: no, 1: yes)
SUPPORT_SUDO_URL	35	UInt8	/sudo URL is available to switch users (0 or not present: no, 1: yes)
IS_IN_FORCE_PWD_MODE	36	UInt8	Device has no password at the moment and will force the user to set one
IS_PTZ_IN_VCD	37	UInt8	PTZ information can be found in VCD stream (this capability is necessary for the VCA global field feature)
CODER_SPEC_ENC_PROF	38	UInt8	coder specific encoder presets
POE_BASE_CLASS_TAG	39	UInt8	base PoE class of device, without consideration of power adder values (1: class0, 2: class1, 3: class2, etc. 255: no PoE)
SOD_DETECTION_TAG	40	UInt8	SOD detection is available
VIDEO_LINE_DUO	41	UInt8	device signals duo line possibility (bit per camera line)
ISCSI_SUPPORT	42	UInt32	iSCSI capabilities (bitfield, each bit represents a capability):\n\tBit 0: Support for NetApp E2800\n\tBit 1 : Support for Multipathing("\n\tNetApp specific style")
INDIVIDUAL_ENCODER_OPERATION_MODE_CONFIG	43	UInt16	1: invidual encoder configuration mode: In CONF_CODER_VIDEO_OPERATION_MODE, num parameter for a specific absolute coder has to be provided; global configuration (numDesc = 0) is not supported 0: global encoder configuration mode : in CONF_CODER_VIDEO_OPERATION_MODE, num parameter supports only 0 as global option for all possible encoders
WIFI_TAG	44	UInt8	Wifi support (0: no, 1: yes, as station, 2: yes, as access point)
C_MOUNT_LENS_TYPE	45	UInt8	Device has a changable lens C-mount (0: device has a fix attached lens, 1: yes, lens is changable)
TC_ENC_H265_TAG	46	UInt8	
NET_DYNAMIC	47	UInt8	device supports network configuration at runtime
KINESIS_SUPPORT	48	UInt8	Decide supports streaming to kinesis
AWS_S3_SUPPORT	49	UInt8	Device supports streaming to amazon s3
RCP_UDP_PAYLOAD_ENCRYPTION	50	UInt8	Device supports rcp udp payload encryption
IMU_TAG	51	UInt8	number of IMU sensors (Inertial Measurement Unit; acceleration, gyroscope, ..)
CLOUD_WATCH_SUPPORT	52	UInt8	device supports logging to cloud watch
CALIBRATION_LINE_DEPENDENCIES	53	PUInt8	returns the information calibration dependencies between lines, if missing then all lines are independent,

CONF_DEVICE_OPERATION_MODE_VERSIONS

Tag code	NumDes	Message	SNMP Support
0x0b61	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	information about device operation_modes, see
Write	p_octet	access_right_minimal	not supported

Response Payload Structure

operation mode version info 1 - N

A list of operation mode version info structures.

type	specific information
1 Byte	N Bytes ...

type

type of the operation mode version info structure.

Values:

recording configuration version	0x01
---------------------------------	------

specific information

specific information depending on the type.

operation mode version info: recording configuration version structure

0x01	variant	version
1 Byte	1 Byte	2 Bytes

variant

Varian of the recording configuration.

Values:

profile configuration mode	0	Configuration has to be done by command CONF_HD_RECORD_PROFILES
stream configuration mode	1	Configuration has to be done by command CONF_HD_RECORD_PROFILES_V2

version

Version of the recording configuration. Current version is 1.

CONF_DEVICE_OPERATION_MODE_VERSIONS

This command can be used to get a hint for changes between firmware versions or differences between device types concerning handling or way of configuration of the devices for several aspects. In order to parse the response payload, first check the first byte of a operation mode version info structure, which is the type and depending on the type read the remaining payload of the structure. Do this again for all following operation mode version info structures until the end of the response payload.

CONF_SOFT_VARIANT_ID

Tag code		NumDes	Message	SNMP Support
0x0bb2		-	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the soft variant Id if set; (notice: if no soft variant ID is set, the 'original' variantID will be returned)	
			Set a soft variant ID. Only possible on certain devices. For a list of allowed soft variants see CONF_SOFT_VARIANT_ID_OPTIONS. All configuration except IP/subnet mask and DHCP settings will be set to default and the device reboots automatically. (Notice: only for some special soft variants which have the option flag 'no factory defaults performed' (see CONF_SOFT_VARIANT_ID_OPTIONS), the device configuration will be kept and not set to defaults.	
Write	t_dword	access_right_service		

CONF_SOFT_VARIANT_ID_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0bb6		-	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get a list of possible soft variant IDs plus the according variant name. 1st byte: number of IDs. 2nd byte: Flags (0x01: no 'factory defaults' performed). 3rd-4th byte reserved. Then n times: 1 dword id + 60 bytes (zero-terminated) camera name string; Notice: if no soft variant IDs are possible, an empty payload will be returned.	
Write	p_octet	access_right_service	not supported	

CONF_APPLICATION_TYPE

Tag code		NumDes	Message	SNMP Support
0x0c47		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	returns the application type	
Write	t_octet	access_right_minimal	-	

CONF_SECURITY_COPROC_VERSION

Tag code		NumDes	Message	SNMP Support
0x0b93		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	read the security coproc version (read-only)	
Write	%	access_right_minimal	%	

CONF_SECURITY_COPROC_CERTIFICATE

Tag code		NumDes	Message	SNMP Support
0x0b91		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read the security coproc device certificate (X.509-certificate ASN.1-DER coded)	
Write	%	access_right_minimal	%	

CONF_SECURITY_COPROC_AUTHENTICATE

Tag code		NumDes	Message	SNMP Support
0x0b92		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read with incoming payload: send a challenge for device authentication (16 bytes: 8 random bytes + the 8 byte sequence 0x4E, 0x58, 0x50, 0x48, 0x41, 0x2E, 0x30, 0x31), read the 128 bytes challenge response	
Write	%	access_right_minimal	%	

CONF_TRANSCODER_INFORMATION

Tag code	NumDes	Message	SNMP Support
0xd060	-	no	no
Datatype	Access Level	Description	
Read	access_right_live	see detailed description	
Write	access_right_minimal	%	

Payload Structure

tag

Values:

Transcoder state: 0: Not present, 1: connected	1
Version (null terminated string)	2
Number of sessions total	3
Number of sessions local	4
Number of sessions dedicated	5
Sessions in use total	6
Sessions in use local	7
Sessions in use dedicated	8
Session in use local by other VRM	9
Sessions available total	10
Sessions available local	11
Sessions available dedicated	12
Sessions offline	13

len

len of data

data

len bytes of data

CONF_TRANSCODER_CAPABILITIES

Tag code	NumDes	Message	SNMP Support
0x0c0d	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns capabilities of a transcoder device in a tagged format
Write	p_octet	access_right_minimal	not supported

lists transcoder capabilities in a tagged format.

Tagged Payload Structure (T(ag) L(ength) V(alue))

num Entries

The total number of tagged entries.

length

The length of the payload. The payload of a tag must be in network byte-order.

tags

The following tags are defined:

Tag Name	Tag ID	Tag Type	Tag description
TC_TAG_MAX_RESOLUTION	0	Resolution	
TC_TAG_MAX_SUBVIEWS	0	UInt8	

CONF_HOST_NAME

Tag code		NumDes	Message	SNMP Support
0x0cda		no	no	no
Datatype		Access Level	Description	
Read	p_unicode	access_right_minimal	read the host name	
Write	p_unicode (max 128 unicode character)	access_right_service	set host name	

CONF_STARTPAGE_BACKGROUND_URL

Tag code		NumDes	Message	SNMP Support
0x028d		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	get the URL of the startpage' background image (max 64 char)	
Write	p_string	access_right_service	set the URL of the startpage' background image (max 64 char)	

CONF_STARTPAGE_LOGO_URL

Tag code		NumDes	Message	SNMP Support
0x028e		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	get the URL of the startpage' OEM logo image (max 64 char)	
Write	p_string	access_right_service	set the URL of the startpage' OEM logo image (max 64 char)	

CONF_STARTPAGE_PRESENTATION_SWITCHES

Tag code	NumDes	Message	SNMP Support
0x028f	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get switches for HTML startpage presentation (usage is up the the user)
Write	t_dword	access_right_service	set switches for HTML startpage presentation (usage is up the the user)

CONF_DYNAMIC_HTML_NAME

Tag code	NumDes	Message	SNMP Support
0x0298	yes	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	get the name for a dynamic HTML page (num range 1..4)
Write	p_string	access_right_service	set the name for a dynamic HTML page (num range 1..4) (max. 19 char)

CONF_DYNAMIC_HTML_DATA

Tag code	NumDes	Message	SNMP Support
0x0299	yes	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	set the data(content) for a dynamic HTML page (num range 1..4) (max. 2048 char)
Write	p_octet	access_right_service	set the data(content) for a dynamic HTML page (num range 1..4) (max. 2048 char)

CONF_BROWSER_LANGUAGE_VAL

Tag code		NumDes	Message	SNMP Support
0x01e3		no	no	no
Datatype		Access Level	Description	
Read	t_octet	unprotected	read current set browser language	
Write	t_octet	access_right_service	set browser language (numbering depends on toolkit implementation)	

CONF_BROWSER_DATETIME_FORMAT_VAL

Tag code		NumDes	Message	SNMP Support
0x01e9		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	read browser date/time format	
Write	t_octet	access_right_service	set browser date/time format (1=Europe, 2=USA, 3=Japan)	

CONF_DATE_WDAY

Tag code		NumDes	Message	SNMP Support
0x0027		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	"Sunday" ... "Saturday"; read the weekday according to the systems date setting	
Write	void	access_right_service	not supported	

CONF_DATE_DAY

Tag code		NumDes	Message	SNMP Support
0x0028		no	no	no
Datatype		Access Level	Description	
Read	t_octet or p_string (2 chars length)	access_right_minimal	read the day of month	
Write	t_octet	access_right_service	set the day of month, not supported while recording is running or configured to active	

CONF_DATE_MONTH

Tag code		NumDes	Message	SNMP Support
0x0029		no	no	no
Datatype		Access Level	Description	
Read	t_octet and p_string (2 chars length)	access_right_minimal	read the month	
Write	t_octet	access_right_service	set the month, not supported while recording is running or configured to active	

CONF_DATE_YEAR

Tag code		NumDes	Message	SNMP Support
0x002a		no	no	no
Datatype		Access Level	Description	
Read	t_word and p_string (4 chars length)	access_right_minimal	read the year	
Write	t_word	access_right_service	xx set the year; century needed, not supported while recording is running or configured to active	

CONF_TIME_HRS

Tag code		NumDes	Message	SNMP Support
0x002d		no	no	no
Datatype		Access Level	Description	
Read	t_octet and p_string (2 chars length)	access_right_minimal	read the hours	
Write	t_octet	access_right_service	set the hours, not supported while recording is running or configured to active	

CONF_TIME_MIN

Tag code		NumDes	Message	SNMP Support
0x002c		no	no	no
Datatype		Access Level	Description	
Read	t_octet and p_string (2 chars length)	access_right_minimal	read the minutes	
Write	t_octet	access_right_service	set the minutes, not supported while recording is running or configured to active	

CONF_TIME_SEC

Tag code		NumDes	Message	SNMP Support
0x002b			no	no
Datatype		Access Level	Description	
Read	t_octet and p_string (2 chars length)	access_right_minimal	read the seconds	
Write	t_octet	access_right_service	set the seconds, not supported while recording is running or configured to active	

CONF_TIMEZONE

Tag code		NumDes	Message	SNMP Support
0x024e		no	no	yes
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	the timezone in which the unit has to operate (GMT +- nbr of seconds +- nbr of seconds DLS), read only version 2.50	
Write	t_int	access_right_service	the timezone in which the unit has to operate (GMT +- nbr of seconds +- nbr of seconds DLS), read only since version 2.50	

CONF.UTC_ZONEOFFSET

Tag code		NumDes	Message	SNMP Support
0x031f		no	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	the timezone in which the unit has to operate (GMT +- nbr of seconds)	
Write	t_int	access_right_service	the timezone in which the unit has to operate (GMT +- nbr of seconds)	

CONF_NTP_SERVER_IP_STR

Tag code		NumDes	Message	SNMP Support
0x024f		no	no	yes
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	reads the time servers ip address ("xxx.xxx.xxx.xxx", or URL) used to sync time from	
Write	p_string	access_right_service	sets the ntp server ip (as string; "xxx.xxx.xxx.xxx" or URL) to sync time from	

CONF_NTP_SYNC_MODE

Tag code	NumDes	Message	SNMP Support
0x031e	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	returns mode which is used by time server, time server(0), SNTP server(1), off(2)
Write	t_dword	access_right_service	selects mode which is used to sync time on this machine, time server(0) SNTP server(1), off(2), tls_date(3)

CONF_NTP_SYNC_MODE_INTERNAL

Tag code	NumDes	Message	SNMP Support
0x0321	Message : no	Description : returns mode which is used by time server, time server(0), SNTP server(1), off(2)	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	t_dword	access_right_internal	selects mode which is used to sync time on this machine, time server(0) SNTP server(1), off(2), tls_date(3), writing does not implicitly clear CONF_ALLOW_OVERWRITE_TIMESRVIP_BY_DHCP

CONF_DAY_LIGHT_SAVE_TIME_TABLE

Tag code	NumDes	Message	SNMP Support
0x0987	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read 20 entries for daylight save time: UTC time in sec since 2000 (4byte) and associated offset in sec (4 signed bytes), unused entries have to be filled with zero
Write	p_octet	access_right_service	write 20 entries for daylight save time: UTC time in sec since 2000 (4byte) and associated offset in sec (4 signed bytes), unused entries have to be filled with zero

CONF_DAY_LIGHT_SAVE_TIME

Tag code	NumDes	Message	SNMP Support
0x0988	no	no	no
Datatype	Access Level	Description	
Read	t_int	access_right_minimal	read the currently used day light save time offset in seconds
Write	t_int	access_right_service	write the day light save time offset in seconds; the device updates this from DAY_LIGHT_SAVE_TIME_TABLE to show current offset used

CONF_FORCE_TIME_SET

Tag code	NumDes	Message	SNMP Support
0x0a0f	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read the time, 8 bytes payload, offset 0: year (word); offset 2: month (octet); offset 3: day (octet); offset 4: hrs (octet); offset 5: min (octet); offset 6: sec (octet); offset 7: reserved (octet)
Write	p_octet	access_right_service	set the time, if recording is running it will be stopped and restarted, parameter 8 bytes payload, offset 0: year (word); offset 2: month (octet); offset 3: day (octet); offset 4: hrs (octet); offset 5: min (octet); offset 6: sec (octet); offset 7: reserved (octet)

CONF_SYSTEM_DATETIME_V2

Tag code	NumDes	Message	SNMP Support
0x0ba8	if set to 0xFFFF the daylight saving values are not overwritten if not present	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	gets the system date and time and the daylight savings in one step: yyyy-mm-ddThh:mm:ss; PosixTimezone; optional string: yyyy->year,mm->month,dd->day,T->beginning of the time section,hh->hour,mm->minute,ss->second (all time values are utc time); The Time Zone format is specified by POSIX, refer to POSIX 1003.1 section 8.3. (the PosixTimezone string is only included if written by that command. If not present the corresponding settings are cleared).
Write	p_string	access_right_service	writes the system date and time and the daylight savings in one step: yyyy-mm-ddThh:mm:ss; PosixTimezone; optional string: The Time Zone format is specified by POSIX, refer to POSIX 1003.1 section 8.3

CONF_ALLOW_OVERWRITE_TIMESRVIP_BY_DHCP

Tag code	NumDes	Message	SNMP Support
0x0c0e	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	allow or deny that dhcp overwrites time/ntp srv ip, 0 = deny, 1 = allow
Write	t_octet	access_right_service	allow or deny that dhcp overwrites time/ntp srv ip, 0 = deny, 1 = allow

CONF_OPTIONAL_TIME_SERVER_PORT

Tag code	NumDes	Message	SNMP Support
0x0c40	no	no	no
Datatype	Access Level	Description	
Read	t_word	access_right_minimal	get the optional/alternative time server port. If not set (0), the according standard port will be used (depending on the configured time server mode)
Write	t_word	access_right_service	Set an optional/alternative time server port. If not set (0), the according standard port will be used (depending on the configured time server mode).

CONF_NTP_START_SERVER

Tag code	NumDes	Message	SNMP Support
0x0c63	no	no	no
Datatype	Access Level	Description	
Read	f_flag	access_right_minimal	reads if the NTP server of the camera should be started
Write	f_flag	access_right_service	set if the NTP server of the camera should be started (0 = do not start; 1 = start server)

CONF_TIME_SC_CONNECT_FAIL_MSG

Tag code	NumDes	Message	SNMP Support
0x0ce0	no	yes	yes
Datatype	Access Level	Description	
Read	t_octet	access_right_internal	neither read nor write access, only message, 1 = connect to server for time sync failed
Write	t_octet	access_right_service	neither read nor write access, only message, 1 = connect to server for time sync failed

CONF_PASSWORD_SETTINGS

Tag code	NumDes	Message	SNMP Support
0x028b	password level	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	get the unit password (scrambled). num parameter sets the password levels; 1=user, 2=service, 3=live
Write	p_string	access_right_service	set the unit password. num parameter sets the password levels; 1=user, 2=service, 3=live; Notice: only standard ASCII characters allowed!

CONF_REMOTE_PASSWORD

Tag code	NumDes	Message	SNMP Support
0x010c	destination IP number	no	no
Datatype	Access Level	Description	
Read	void	access_right_minimal	not supported
Write	p_string	access_right_service	deposit the password of the called station

CONF_ACCOUNT_SETTINGS

Tag code		NumDes	Message	SNMP Support
0x0b5e		yes (index of the account 1...4)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	gets the account information: 4 bytes types (0: no; 1: ftp; 2: dropbox),32 bytes: name, 64 bytes username (ftp only), 32 bytes password (ftp only), 64 bytes path, 64 bytes optional url (e.g ip of the ftp server, unused for dropbox)	
Write	p_octet	access_right_service	stores the account information: 4 bytes types (0: no; 1: ftp; 2: dropbox; 4: recording), 32 bytes name, 64 bytes username (ftp only), 32 bytes password (ftp only), 64 bytes path, 64 bytes optional url (e.g ip of the ftp server, unused for dropbox), 4 bytes optional flags (e.g. FTP Encryption mode 0=off,1=TLS)	

CONF_ACCOUNT_SETTINGS_V2

Tag code		NumDes	Message	SNMP Support
0x0cc0		yes (index of the account 1...4)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	returns account settings in a tagged format	
Write	p_octet	access_right_service	

lists account tags.

Tagged Payload Structure (T(ag) L(ength) V(alue))

num Entries

The total number of tagged entries.

length

The length of the payload. The payload of a tag must be in network byte-order.

tags

The following tags are defined:

Tag Name	Tag ID	Tag Type	Tag description
ACCOUNT_TAG_TYPE	1	UInt32	0: not configured, 1: ftp, 2: dropbox, 5: amazon s3, 6: kinesis
ACCOUNT_TAG_NAME	2	PChar	account name
ACCOUNT_TAG_URL	3	PChar	url, e.g url to the ftp server
ACCOUNT_TAG_LOGIN	4	PChar	username
ACCOUNT_TAG_PASSWORD	5	PChar	password
ACCOUNT_TAG_PATH	6	PChar	path
ACCOUNT_TAG_FLAGS	7	UInt32	optional flags (e.g. FTP Encryption mode 0=off,1=TLS)
ACCOUNT_TAG_ACCESS_KEY	8	PChar	aws access key (max 128 bytes)
ACCOUNT_TAG_SECRET_KEY	9	PChar	aws secret access key (max 128 bytes)
ACCOUNT_TAG_BUCKET_NAME	10	PChar	bucket name (amazon s3), max 128 bytes
ACCOUNT_TAG_REGION	11	PChar	aws region
ACCOUNT_TAG_CAMERA_ID	12	PChar	s3 camera id, string will be added to the uploaded filename (max 128 bytes)
ACCOUNT_TAG_FILE_DURATION	13	PChar	s3 file duration in seconds
ACCOUNT_TAG_STREAM_NAME	14	PChar	stream name
ACCOUNT_TAG_KBPS	15	UInt32	maximum datarate for the backup, see CONF_BACKUP_MAX_KBPS
ACCOUNT_TAG_GROUP	16	PChar	cloud watch log group
ACCOUNT_TAG_CLOUD_WATCH_ENABLED	17	UInt8	cloud watch enabled/disabled

CONF_NBR_OF_ACCOUNTS

Tag code	NumDes	Message	SNMP Support
0x0b62	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	gets the max number of accounts
Write	t_dword	access_right_service	not supported

CONF_DROPBOX_AUTH_ADDR

Tag code	NumDes	Message	SNMP Support
0x0b81	account idx	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	gets the url that should be used to login at dropbox (payload url)
Write	p_string	access_right_minimal	gets the url that should be used to login at dropbox (payload url)

CONF_DROPBOX_AUTH_STATUS

Tag code	NumDes	Message	SNMP Support
0x0b82	account idx	yes	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	gets authentication status (0: not authenticated, 1: authenticated, 2: authentication session timed out, 3: failed)
Write	t_octet	access_right_minimal	not supported

CONF_DROPBOX_TOKEN_V2

Tag code	NumDes	Message	SNMP Support
0x0c7a	account idx	no	no
	Datatype	Access Level	Description
Read	p_octet	access_right_service	gets the dropbox token (v2)
Write	p_octet	access_right_service	sets the dropbox token (v2), max 256 bytes

CONF_DROPBOX_AUTH_V2

Tag code	NumDes	Message	SNMP Support
0x0c7b	account idx	no	no
	Datatype	Access Level	Description
Read	p_string	access_right_service	not supported
Write	p_string	access_right_service	the dropbox authorization code and start the process to get the dropbox access token

CONF_ACCOUNT_STATUS

Tag code	NumDes	Message	SNMP Support
0x0bde		message only	no
	Datatype	Access Level	Description
Read	t_octet	access_right_minimal	provides information if connection to a account fails (1: ftp, 2: dropbox)
Write	t_octet	access_right_minimal	provides information if connection to a account fails (1: ftp, 2: dropbox)

CONF_ADV_USER_SETTINGS

Tag code	NumDes	Message	SNMP Support
0x0bda	no	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_live	
Write	p_octet	access_right_service	

Payload Structure

length	tag
2 Byte	2 Byte
value	
(length - header) Bytes ...	
length	tag
2 Byte	2 Byte
value	
(length - header) Bytes ...	
8	24

length

length of tagged value including length and tag field

tag

tag specifying the encoding and meaning of the value

value

value payload data (length - header bytes), can contain tagged values

General Description

Command CONF_ADV_USER_SETTINGS allows to query or configure user entries for camera access control. User entries are identified by the user name, the user name of each entry must be unique.

In read direction only the user name is used to find the user entry to query the user configuration.

In write direction an already existing user with the same name is modified or a new user with the given configuration is created.

Supported lengths, types and restrictions can be queried using CONF_ADV_USER_SETTINGS_OPTIONS.

Tag Structure

length	tag = 0 (User Entry)
2 Byte	2 Byte
length	tag = 1 (User Name)
2 Byte	2 Byte
user name	
(length - header) Bytes ...	
length	tag = 2 (User Type)
2 Byte	2 Byte
user type	
4 Bytes (network byte order)	
length	tag = 3 (User Group)
2 Byte	2 Byte
user level	
4 Bytes (network byte order)	
length	tag = 4 (User Password)
2 Byte	2 Byte
user password	
(length - header) Bytes ...	
length	tag = 5 (Expires)
2 Byte	2 Byte
Seconds this user should live (only when type == 3)	
4 Bytes (network byte order)	
8	24

tag = 0 (User Entry)

The payload of tag user entry contains further tagged values described below.

tag = 1 (User Name)

The payload of tag user name contains the user name string which is used to identify a user.

tag = 2 (User Type)

The payload of tag user type contains the user type (values defined below).

Changing the type of an existing user to Deleted will delete the user.

A User Entry of type Password must contain a password entry. A User Entry of type 'Temporary with password' must contain a password entry and an 'Expires' entry.

user type

Values:

Deleted	0
Password	1
Certificate	2

Temporary with password	3
Cloud	4 (read only)

tag = 3 (User Group)

The payload of tag user group contains the user group. Each group has a unique ID you can request the group name with a seperate RCP command.

user groups

Values:

Live Group	1
User Group	2
Service Group	3

tag = 4 (User Password)

The payload of tag user password contains the user password.

This field is only mandatory when configuring a user of type Password and will be empty when read if there is no password or just '*****' when a password is set.

tag = 5 (Expires)

The 'Expires' indicates the life time of the user in seconds. So if the user should life for 1 hour pass the value 3600 here.

The field is mandatory when you create a user of type 'Temporary with password' (3). For all other types this field should not be present or have the payload 0.

On read, this field will indicate the remaining time in seconds until the user will expire.

CONF_ADV_USER_SETTINGS_LIST

Tag code		NumDes	Message	SNMP Support
0x0bdc		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_live	returns a list of tagged values (User Entries), see CONF_ADV_USER_SETTINGS for a detailed description of the payload format	
Write	p_octet	access_right_service	not supported	

CONF_ADV_USER_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0bd9		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	4 bytes max number of users, 4 bytes max user name length, 4 bytes max password length, 1 byte password user support [0 = no, 1 = yes], 1 byte certificate user support [0 = no, 1 = yes]	
Write	p_octet	access_right_minimal	not supported	

CONF_USER_AUTH_MODE

Tag code	NumDes	Message	SNMP Support
0x0be3	no	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_live	
Write	p_octet	access_right_service	

General Description

Command CONF_USER_AUTH_MODE allows to query or enable/disable user authentication modes.

Payload Structure

length

length of tagged value including length and tag field

tag = 0 (Auth Modes)

tag specifying the encoding and meaning of the value

active user auth modes

bit mask containing the active user authentication modes

Values:

- | | |
|------------------------------|---|
| Password Auth | 1 |
| Certificate Auth | 2 |
| Active Directory (ADFS) Auth | 4 |

CONF_MIN_TLS_VERSION

Tag code		NumDes	Message	SNMP Support
0x0c56		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	Get the TLS version minimal required to connect to the device. Word coding: bit 15-8 mayor version, bit 7-0 minor version. E.g. 0x0102 is TLSv1.2	
Write	t_word	access_right_service	Set the TLS version minimal required to connect to the device. Word coding: bit 15-8 mayor version, bit 7-0 minor version. E.g. 0x0102 is TLSv1.2	

CONF_ENABLE_MASTERPWD

Tag code		NumDes	Message	SNMP Support
0x0c6d		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	Shows if the the password reset mechanism is enabled (== 1) or disabled (== 0).	
Write	f_flag	access_right_service	Enable or disable the password reset mechanism (1 == enable, 0 == disable). Disable it if you don't want that Bosch support can reset the passwords of your camera.	

CONF_ACCESS_OPTION

Tag code		NumDes	Message	SNMP Support
0x0c7f		no	no	no
Datatype		Access Level	Description	
Read	t_octet	unprotected	read the current access options. 0=normal access, Bit1: camera is in 'force initial password' mode. I.e. before further usage an initial service password must be set.	
Write	t_octet	access_right_service	not supported	

CONF_MASTERPWD_CHALLENGE

Tag code		NumDes	Message	SNMP Support
0x013f		no	no	no
Datatype		Access Level	Description	
Read	p_string	unprotected	generates an password challenge which has to be passed to the operator for password reset	
Write	p_string	unprotected	provide the generated unlock key from operator to reset passwords. The key has to be in hex string representation without 0x in front.	

CONF_MASTERPWD_CHALLENGE_STATE

Tag code	NumDes	Message	SNMP Support
0x0c21	no	no	no
Datatype	Access Level	Description	
Read	p_octet	unprotected	retrieves status information about the masterpwd challenge (4 bytes validity in seconds, 4 bytes lock state)
Write	%	unprotected	%

CONF_CERTIFICATE

Tag code	NumDes	Message	SNMP Support
0x0be9	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	see detailed description
Write	p_octet	access_right_service	see detailed description

Payload Structure

length	tag
2 Byte	2 Byte
value	
(length - header) Bytes ...	
length	tag
2 Byte	2 Byte
value	
(length - header) Bytes ...	
8	24

Generic description

The command CONF_CERTIFICATE supports the following operations:

- Upload a certificate optionally including its private key.
- Download a certificate or signing request from the device.
- Delete a certificate or signing request. A delete implicitly deletes an associated private key.

Each certificate/signing request/key is identified by a unique label.
If a certificate has a matching private key both have the same label.
When the command fails it returns a command specific error code in the payload
On upload the command supports the following file formats:

- PEM: PEM file format. With this format you can upload a certificate and a key at once. For this you must set Certificate and Private Key bits in type tag.
- DER: Binary DER file format. For this file format you can only upload one type of content and the type must be exactly specified in type tag.
- PKCS#12 or PFX: PKCS#12 (sometimes also called PFX) file format. This file format carried information what is included, so you can upload certificate and key in one file. The type tag does not matter when using this file format and can be set to certificate and key or even be not provided

You can also use this command to upload encrypted private keys as PEM, DER or PKCS12 file. To do this you upload the file containing the encrypted key. The device stores the encrypted key internally and waits, that the password is provided later with help of the CONF_CERTIFICATE_REQUEST command.
To **delete** a certificate/CSR or key you have to provide the following tags: Tag 0 with the label, tag 1 with 0, tag 2 with length 4 and no data and tag 3 with entry type 0xFF (delete).
Example Payload for delete of cert with label 'test': 0008000074657374 0008000100000000 00040003000000FF

Tag Label

Contains the label string, no zero termination. For the maximum supported length see CONF_CERTIFICATE_OPTIONS.

length	tag = 0
2 Byte	2 Byte
certificate/signing request/key label	
(length - header) Bytes...	
16	32

Tag Format

Specifies the certificate/signing request/key data format (PEM / DER / PKCS#12(PFX) is supported).

length = 8	tag = 1
2 Byte	2 Byte
format	
4 Bytes	
16	32

Entry type

Values:

PEM	0
DER	1
PKCS#12 / PFX	2

Tag Data

Contains the certificate/signing request/key data in the specified format.
If this tag contains no data (zero payload length) the corresponding entry is deleted from the device.

length	tag = 2
2 Byte	2 Byte
data	
(length - header) Bytes...	
16	32

Tag Entry Type

Specifies the entry type for read and write. This tag is mandatory for PEM and DER format and should appear only once.

length = 8 2 Byte	tag = 3 2 Byte
Entry type 4 Bytes	

16

32

Entry type

Values:

Certificate	1
Signing request(read or delete only)	2
Private key(write only)	4
Encrypted key(write only)	8
Any type(delete only)	255

Tag Protection

Contains a bit mask showing the protection bits of the certificate. Each bit of the 32 bit value shows a specific protection.

length = 8 2 Byte	tag = 4 2 Byte
Protection Bits 4 Bytes	

16

32

Protection bits

Values:

Protect at factory reset	bit0(0x1)
--------------------------	-----------

Specific Error Types

CERTIFICATE_CMD_ERROR_FAIL	0x00
CERTIFICATE_CMD_ERROR_INV_ARGS	0x01
CERTIFICATE_CMD_ERROR_ALREADY_EXISTS	0x02
CERTIFICATE_CMD_ERROR_FORMAT	0x03
CERTIFICATE_CMD_ERROR_NO_CERT_FOR_KEY	0x04
CERTIFICATE_CMD_ERROR_NO_KEY_ENTRY	0x05
CERTIFICATE_CMD_ERROR_NO_STORAGE_SPACE	0x06

CONF_CERTIFICATE_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0bea		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	4 bytes max label length, 1 byte certificate store support [0 = no, 1 = yes]	
Write	p_octet	access_right_minimal	not supported	

CONF_CERTIFICATE_LIST

Tag code		NumDes	Message	SNMP Support
0x0beb		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	see detailed description	
Write	p_octet	access_right_service	not supported	

Payload Structure

16		32	
length 2 Byte	tag 2 Byte		
value (length - header) Bytes ...			
length 2 Byte	tag 2 Byte		
value (length - header) Bytes ...			
8		24	

length

length of tagged value including length and tag field

tag

tag specifying the encoding and meaning of the value

value

value payload data (length - header bytes), can contain tagged values

Generic description

Command CONF_CERTIFICATE_LIST allows to query the labels of all certificates, signing requests and keys installed on a device.
The command CONF_CERTIFICATE can then be used to retrieve a certificate or signing request using the label.
The format has an internal tagged structure. Some tags are optional and might be absent if the data is not available. The tags are always in the sequence as listed below.

Tag Structure

32

length 2 Byte	tag = 0 (List entry) 2 Byte
length 2 Byte	tag = 1 (Entry label) 2 Byte
entry label (length - header) Bytes ...	
length 2 Byte	tag = 2 (Type) 2 Byte
type 4 Bytes	
length 2 Byte	tag = 3 (Subject Common name) 2 Byte
certificate subject common name (length - header) Bytes ...	
length 2 Byte	tag = 4 (Protection Bitmap) 2 Byte
Protection Bits of this entry 4 Bytes ...	
length 2 Byte	tag = 5 (Issuer Common name) 2 Byte
certificate issuer common name (length - header) Bytes ...	
length 2 Byte	tag = 6 (NotAfterUTC) 2 Byte
(optional see below) certificate not after as UTC string (length - header) Bytes ...	
length 2 Byte	tag = 7 (NotAfterGT) 2 Byte
(optional) certificate not after as General Time (GT) string (length - header) Bytes ...	

8

24

tag = 0 (List entry)

The payload of tag list entry contains further tagged values described below.
For each certificate, signing request or key with unique label on the device one list entry tag is contained in the command payload.

tag = 1 (Entry label)

Contains the entry label string, no zero termination.

tag = 2 (Entry type)

Contains the entry type bitmask. All types with the same label are listed together as one entry.

entry type

<u>Values:</u>	
Certificate	bit0(0x1)
Signing request	bit1(0x2)
Private key	bit2(0x4)
Encrypted private key	bit3(0x8)
Certificate generation in progress	bit4(0x10)
Signing request generation in progress	bit5(0x20)
Key decryption in progress	bit6(0x40)
Encrypted PKCS#12	bit7(0x80)

tag = 3 (Certificate's subject common name)

Contains the subject common name string (UTF-16) of the certificate or signing request. This entry is optional and only used for certificates and signing requests.

tag = 4 (Protection Bitmap)

Show the protection bits of this entry. This tag is optional if the type supports protection bits and if any protection is set. If this tag is missing, the item is unprotected. The following values are possible:

Protection Types

<u>Values:</u>	
Protect at factory reset	bit0(0x1)
Protect from manual deletion	bit1(0x2)

tag = 5 (Certificate's issuer common name)

Contains the issuer common name string (UTF-16) of the certificate. This entry is optional and only used for certificates.

tag = 6 (Certificate's not after timestamp in UTC)

Contains the UTC string (UTF-16, format YYMMDDhhmmssZ) of the not after timestamp of the certificate . This entry is optional and only used for certificates. If tag = 7 (Certificate's not after timestamp in GT) is present you should always use the date from there as UTC is limited to 1950-01-01 up to 2049-12-31. For compatibility reason both tags will be present when the date can be presented in both formats.

tag = 7 (Certificate's not after timestamp in GT)

Contains the General time (GT) string (UTF-11, format YYYYMMDDhhmmssZ) of the not after timestamp of the certificate. This entry is optional and only used for certificates. Thisa entry should always be used instead of tag 6 (Certificate's not after timestamp in UTC) because of it's wider time range.

CONF_CERTIFICATE_REQUEST

Tag code	NumDes	Message	SNMP Support
0x0bec	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	not supported
Write	p_octet	access_right_service	see detailed description

Payload Structure

length 2 Byte	tag 2 Byte
payload (length - header) Bytes	
16	32

Generic description

The command CONF_CERTIFICATE_REQUEST allows to start a certificate signing request or a key decryption operation.

Since both operations may take some time to complete, this command may return before the actual completion of the operation.

The progress of the operation can be tracked by registering for the CONF_CERTIFICATE_REQUEST_PROGRESS message.

Tag Label

Contains the label string, no zero termination. Access the generated private key and the signed certificate using the provided label after the process has finished successfully.

For key decryption this label is used to identify the key to be decrypted.

length 2 Byte	tag = 0 2 Byte
certificate/key label (length - header) Bytes...	
16	32

Tag Type

Specifies the certificate operation type.

The mandatory/supported tags of the command vary based on the operation type. See CONF_CERTIFICATE_REQUEST_OPTIONS for a list of supported commands.

length 2 Byte	tag = 2 2 Byte
Type 4 Bytes	
16	32

Type

Values:	
create PKCS#10 CSR	0
create self-signed certificate	3
decrypt private key	4

Tag Key Type

Specifies the key type for the signing request/certificate to be generated. The list of supported types for a specific device can be requested using command CONF_CERTIFICATE_REQUEST_OPTIONS.

length = 4 2 Byte	tag = 1 2 Byte
key type 4 Bytes	
16	32

key type

Below enumeration lists example values for the key type association:

Values:	
RSA 1024bit	0
RSA 2048bit	1
Elliptic Curve P256	2

Tag CA Server IP

Specifies the IP address string of the CA server, no zero termination.

This tag is optional and only used when a signing request is sent to a server.

length 2 Byte	tag = 3 2 Byte
server IP (length - header) Bytes...	
16	32

Tag CA Server Port

CA server port: tag = 4

Specifies the CA server port.
This tag is optional and only used when a signing request is sent to a server.

length 2 Byte	tag = 4 2 Byte
server port 4 Bytes	
16	32

Tag Common Name

Contains the common name string (UTF-16) for the certificate/signing request, no zero termination. This tag is optional.

length 2 Byte	tag = 5 2 Byte
common name (length - header) Bytes...	
16	32

Tag Organization Name

Contains the organization name string (UTF-16) for the certificate/signing request, no zero termination.

length 2 Byte	tag = 6 2 Byte
organization name (length - header) Bytes...	
16	32

Tag Unit Name

Contains the organizational unit name string (UTF-16) for the certificate/signing request, no zero termination. This tag is optional.

length 2 Byte	tag = 7 2 Byte
organizational unit name (length - header) Bytes...	
16	32

Tag Locality Name

Contains the locality name string (UTF-16) for the certificate/signing request, no zero termination. This tag is optional.

length 2 Byte	tag = 8 2 Byte
locality name (length - header) Bytes...	
16	32

Tag Country Name

Contains the country name string (UTF-16) for the certificate/signing request, no zero termination. This tag is optional.

length 2 Byte	tag = 9 2 Byte
country name (length - header) Bytes...	
16	32

Tag State or Province Name

Contains the state or province name string (UTF-16) for the certificate/signing request, no zero termination. This tag is optional.

length 2 Byte	tag = 10 2 Byte
state or province name (length - header) Bytes...	
16	32

Tag Password

Contains the password used for private key decryption, no zero termination. This tag is optional.

length 2 Byte	tag = 11 2 Byte
Password (length - header) Bytes...	
16	32

Tag Certificate Extension

With this tag you can provide one X.509 certificate extension which should be added to a self signed certificate or a certificate request (there the extension will be added as ExtensionRequest).
The extension must already be encoded in it's ASN.1 representation as defined for 'Extension' in RFC5280 chapter 4.1. This means a sequence containing an object identifier followed by a bitstring which contains the extension specific payload.
The ASN.1 structure is directly added to the certificate/certificate request, so the caller is responsible for proper content of the extension which will be provided by this tag.
If this tag is missing no extension will be added. It can occur a maximum of 5 times.

length 2 Byte	tag = 12 2 Byte
ASN.1 encoded extension	

(length - header) Bytes ...

16

32

CONF_CERTIFICATE_REQUEST_OPTIONS

Tag code	NumDes	Message	SNMP Support
0x0bed	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	4 bytes max label length, 4 bytes max IP string length, 4 bytes number of supported key types, 4 bytes number of supported cmd types, numKeyTypes * keyType (4 bytes type ID, 64 bytes type label), numCmdTypes * Type (4 bytes cmd type ID, 64 bytes cmd type label), 4 bytes max password length
Write	p_octet	access_right_minimal	not supported

CONF_CERTIFICATE_REQUEST_PROGRESS

0x0bf0	-	yes (Message only)	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	-	access_right_minimal	see detailed description

Payload Structure

length 2 Byte	tag 2 Byte
payload (length - header) Bytes	

16

32

Generic description

This message informs about the current status of certificate/signing request/key operations started by a CONF_CERTIFICATE_REQUEST. The format has an internal tagged structure.

Tags

Status: tag = 0

Contains the command type and its status.

length 2 Byte	tag = 0 2 Byte
Type 4 Bytes	
Status 4 Bytes	

16

32

Type

Values:

create PKCS#10 CSR	0
create self-signed certificate	3
decrypt private key	4

Status

Values:

Values in the range of 0 to 100 represent the current status, other values need to be handled as error.

Status values:

Generating request	25
Sending request	50
Request completed successfully	100

Error values:

General error	129
File already exists error	130
No free key entry error	131
No storage space error	132
Server error	133
Decrypt error	134
Entry not found error	135
No certificate found for key error	136
Error parsing the key structure or key type not supported	137

Tags

Label: tag = 1

Contains the certificate/signing request/key label, no zero termination.

length	tag = 1
--------	---------

Tags

New label: tag = 2

Contains the certificate/signing request/key label, no zero termination.

This tag is optional and is used to transmit the new label that is used to store the entry after the operation is complete (e.g. a key is decrypted and matched against a certificate and stored using the certificate label).

CONF_CERTIFICATE_USAGE

Tag code	NumDes	Message	SNMP Support
0x0bf2	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	see detailed description
Write	p_octet	access_right_service	see detailed description

Payload Structure

length 2 Byte	tag 2 Byte
payload (length - header) Bytes	
16	32

Generic description

Command CONF_CERTIFICATE_USAGE allows to configure for which purpose the certificates and keys on the device are used.

The format has an internal tagged structure, the allowed tags and values can be queried via CONF_CERTIFICATE_USAGE_OPTIONS.

There are two types of certificate usages that can be distinguished by the highest bit of the certUsageID:

0: device certificate chains starting with a label identifying the device certificate and private key (both using the same label) followed by further chain certificates

1: lists of trusted certificates used to verify received peer certificates

Tags

certUsageID: tag = 0

Contains the certificate usage ID. This tag is mandatory for the read and write commands and should appear only once.

length 2 Byte	tag = 0 2 Byte
certUsageID 4 Bytes	
16	32

Tags

Certificate/key label: tag = 1

Contains the label string used to identify the certificate/key, no zero termination. Multiple label tags can be contained in the payload.

length 2 Byte	tag = 1 2 Byte
certificate/key label (length - header) Bytes...	
16	32

CONF_CERTIFICATE_USAGE_OPTIONS

Tag code	NumDes	Message	SNMP Support
0x0bf3	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_minimal	not supported

Payload Structure

Write support 4 Bytes	
Max label length 4 Bytes	
Max number of labels 4 Bytes	
Number of usages 4 Bytes	
First usage entry (4 + "Max label length") Bytes	
"Number of usages" x (4 + "Max label length") Bytes	Usage entries N (4 + "Max label length") Bytes ...

Write support

Certificate usage write support. Indicates wether it is possible to write the certificate usages.

Values:

write not supported	0
write supported	1

Max label length

Maximum length of one label string for the usages.

Values:

Max number of certificates

Defines the maximum number of certificates which can be associated with one usage.

Values:

Number of usages

Amount of usage entries following after this entry.

Values:

Usage entries 1 to "Number of usages"

Each entry consists of 4 byte usageID and the label of the length given in the "Max label length" field.

Values:

General Description

This command returns the list of certificate usages available in the camera. Each usage has a unique ID and a label which can be presneted to the end user. In the CONF_CERTIFICATE_USAGE command the usageID is referenced.

Flags in labelID

Some bits of the usage ID are reserved and contain additional information:

Values

Bit 31 (0x80000000)	0: Certificate is an end-user certificate. Certificates in these usages are presented to a peer for client authentication for example. These usages can only contain one certificate. The certificate must be associated with a private key stored on the device. 1: Certificate is a trusted certificate. Certificates in these usages are used to verify certificates presented from the external peer. These usage can contain multiple certificates. The certificate needs no private key on the device. ATTENTION: This bit is reserved for future use. Planned for the following meaning: This bit is only valid, if bit 31 is 0. 0: This end-user certificate usage (bit 31 is 0) can only be associated with 1 certificate. 1: This end-user certificate usage (bit 31 is 0) can be associated with multiple certificate (not used or supported at the moment).
Bit 30 (0x40000000)	

CONF_STREAM_SECURITY_V2

Tag code		NumDes	Message	SNMP Support
0x0bb8		no	no	no
Datatype		Access Level	Description

Datatype	Access Level	Description	
Read	p_octet	access_right_internal	neither read nor write access, only message, see detailed description
Write	p_octet	access_right_service	neither read nor write access, only message, see detailed description

Payload Structure

Number of Entries	TotalLength
2 Byte	2 Byte
Entry 1 x Bytes	
... y Bytes	
Entry N z Bytes	

Number of Entries

Number of Entries following

TotalLength

Total Length in Bytes, including all entries and this header

Entry

a tagged entry looks like this:

EntryID	EntryLength N = 4 + n Bytes
2 Byte	2 Byte
EntryPayload n Bytes	

EntryID

ID of the entry

ID	Tag	Payload Length	Payload Description
1	LOGIN_LIMITER_MSG_STATUS	1 byte	0: Fail Msg; 1: Success Msg
2	LOGIN_LIMITER_SERVER_NAME	variable n bytes	String with server name
3	LOGIN_LIMITER_REMOTE_ADDRESS	variable n bytes	String with remote address of access origin
4	LOGIN_LIMITER_USER_NAME	variable n bytes	String with user name of access

EntryLength

Length of the entry in bytes, including the payload, but also ID and length field

EntryPayload

Payload of the entry

CONF_NBR_OF_TEMP_SENS

Tag code		NumDes	Message	SNMP Support

Write	t_dword	access_right_service	sets the redundant power 0=off, 1=on	

CONF_POWER_SUPPLY

Tag code	NumDes	Message	SNMP Support
0x09dd	no	yes	yes
Datatype Access Level Description			
Read	t_dword	access_right_user	bit field of power supplies (supply n: supplybits = 1<=(n-1))
Write		access_right_service	Data type : t_dword

CONF_NBR_OF_FANS

Tag code	NumDes	Message	SNMP Support
0x09d5	no	no	no
Datatype Access Level Description			
Read	t_dword	access_right_user	reads the number of fans
Write	t_dword	access_right_service	not supported

CONF_FAN_SPEED

Tag code	NumDes	Message	SNMP Support
0x09d6	fan number	no	yes
Datatype Access Level Description			
Read	t_dword	access_right_user	fan speed in RPM
Write	t_dword	access_right_service	not supported

CONF_MINIMUM_FAN_SPEED

Tag code	NumDes	Message	SNMP Support
0x09de	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_user	minimum fan speed in RPM
Write	t_dword	access_right_service	minimum fan speed in RPM

CONF_BOOT_STATE

Tag code	NumDes	Message	SNMP Support
0x09e3	no	no	no
Datatype	Access Level	Description	
Read	t_dword	unprotected	100 if booted, 50: waiting for camera frontend, 25: waiting for DHCP
Write	t_dword	access_right_service	not supported

CONF_UPLOAD_PROGRESS

Tag code	NumDes	Message	SNMP Support
0x0701	-	yes (Message only)	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	-	access_right_minimal	see detailed description

Payload Structure

Progress
1 Byte

8

Progress

informs about current progress of an upload or possible error states

Values

progress in percent	1 ... 100
header error	101
write error	102
read back error	103
verify error	104
checksum mismatch (read back flash content vs. written data)	105
checksum mismatch (announced in header vs. received data)	106
magic error	110
version too low	111
flash type incompatible	112
device check failed	113
file entry marker failed	114
chunk size error	115
area already written	116
black white list check	117
wrong or no signature	118
signature invalid	119
invalid file name	130
ROM init error	131
ROM write error	132
ROM close error	133
socket error	134
overflow error	135
final flush error	136
file format error	137
logo size error (size of picture is limited to 128x128 pixel)	138
logo compression error (only uncompressed bitmap files allowed)	139
logo colour error (max. 256 colour bitmap supported)	140
certificate/key already exists (filename must be unique)	141
certificate/key format error	142
no matching certificate found for uploaded key (upload certificate first or upload combined file)	143
no free key entry available	144
no certificate storage space available	145
device not fully booted	146
password required for this upload (encrypted config file)	147
no memory to store the file	148
file is to large for that type of upload	149

Values in the range of 1 ... 100 represent the upload progress in percent. Other values need to be handled as error during the upload and inform about the kind of the error that was encountered during the upload.

CONF_HEATER_MODE

Tag code		NumDes	Message	SNMP Support
0x0b0c		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_user	read the heater mode - 0: off, 1: on, 2: auto	
Write	t_octet	access_right_service	write the heater mode - 0: off, 1: on, 2: auto	

CONF_CHECK_DEFAULT_BUTTON_STATE

Tag code		NumDes	Message	SNMP Support
0x0c3b		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	check the current status of the (factory) default button. 0=inactive; 1=active	
Write	%	access_right_service	%	

CONF_CHECK_POS_FB_STATE

Tag code		NumDes	Message	SNMP Support
0x0c3c		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	check the current status of the position feedback sensors. (Only applicable on certain devices). bit 0: end position fb switch, bit 1: hall sensor	
Write	%	access_right_service	%	

CONF_CLOUD_COMMISSIONING_STATUS

Tag code		NumDes	Message	SNMP Support
0x0c44		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the status of cloud commissioning. After successful commissioning, the cloud sets this status so the camera knows about it (and can e.g. change LED accordingly). 0=uncommissioned; 100=commissioning successfully finished	
Write	t_word	access_right_service	store the status of cloud commissioning. After successful commissioning, the cloud sets this status so the camera knows about it (and can e.g. change LED accordingly). 0=uncommissioned; 100=commissioning successfully finished	

CONF_AMBIENT_LIGHT_LEVEL

Tag code		NumDes	Message	SNMP Support
0x0c45		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_user	get the normalized ambient light level (value range: 0-1000; typical values between 0-400); Only available on certain devices	
Write	t_dword	access_right_service	not supported	

CONF_LOW_AMBIENT_LIGHT_THRESHOLD

Tag code		NumDes	Message	SNMP Support
0x0c46		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_user	get the normalized low ambient light level threshold (value range: 0-1000; typical 50); Only available on certain devices; To obtain the current level, see CONF_AMBIENT_LIGHT_LEVEL	
Write	t_dword	access_right_service	set the normalized low ambient light threshold (value range: 0-1000; typical 50); Only available on certain devices; To obtain the current level, see CONF_AMBIENT_LIGHT_LEVEL	

CONF_NBR_OF_HUMIDITY_SENSORS

Tag code		NumDes	Message	SNMP Support
0x0c60		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_user	the number of humidity sensors	
Write	t_dword	access_right_minimal	not supported	

CONF_HUMIDITY_VALUE

Tag code		NumDes	Message	SNMP Support
0x0c61		humidity sensor (1...x)	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_user	value of the humidity sensor specified by numdes (humidity 0 ... 100.00 % maps onto values 0 ... 10000)	
Write	t_dword	access_right_minimal	not supported	

CONF_VIPROC_ID

Tag code		NumDes	Message	SNMP Support
0x0803		video line	yes	yes
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the viproc interface id (0:= no viproc)	
Write	t_dword	access_right_service	not supported	

CONF_RULE_ENGINE_ID

Tag code		NumDes	Message	SNMP Support
0x0b94		video line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	reads the version id of the rule engine	
Write	t_dword	access_right_service	not supported	

CONF_VIPROC_ONOFF

Tag code		NumDes	Message	SNMP Support
0x0800		video line	no	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	reads the VCA status 0=off, 1=on. command is obsolete with firmware 4.0 and replaced by VIPROC_MODE.	
Write	flag	access_right_service	switches on/off the video content analysis (VCA). command is obsolete with firmware 4.0 and replaced by VIPROC_MODE.	

CONF_VIPROC_CUSTOM_PARAMETERS

Tag code		NumDes	Message	SNMP Support
0x0802		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	reads the video content analysis (VCA) custom parameters, payload is beyond the scope of this document	
Write	p_octet	access_right_service	sets the VCA custom parameters, payload is beyond the scope of this document	

CONF_VIPROC_FIRE_PARAMETERS

Tag code		NumDes	Message	SNMP Support
0x0c0c		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	gets the VCA fire detector settings (no vca profiles), payload is beyond the scope of this document	
Write	p_octet	access_right_service	sets the VCA fire detector settings (not part of the vca profiles), payload is beyond the scope of this document	

CONF_VIPROC_CUSTOM_PARAMETERS_TAGS

Tag code		NumDes	Message	SNMP Support
0x0bac		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	reads one or more parameter tags from viproc configuration, payload is beyond the scope of this document	
Write	p_octet	access_right_service	sets one or more tags in the VCA custom parameters, payload is beyond the scope of this document	

CONF_VIPROC_GLOBAL_PARAMETERS

Tag code		NumDes	Message	SNMP Support
0x0b68		break;	ok = false;	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	reads the VCA global parameters, payload is beyond the scope of this document	
Write	p_octet	access_right_service	sets the VCA global parameters, payload is beyond the scope of this document	

CONF_VIPROC_GLOBAL_PARAMETERS_TAGS

Tag code		NumDes	Message	SNMP Support
0x0c68		break;	ok = false;	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	reads the VCA global parameters, payload is beyond the scope of this document	
Write	p_octet	access_right_service	sets the VCA global parameters, payload is beyond the scope of this document	

CONF_VIPROC_DLL_NAME

Tag code		NumDes	Message	SNMP Support
0x0804		video line	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	reads the name of currently selected VCA component	
Write	p_string	access_right_service	specify the name of the VCA component	

CONF_VIPROC_DLL_NAME_LIST

Tag code	NumDes	Message	SNMP Support
0x0808	video line	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	list of viproc component names
Write	p_string	access_right_service	list of viproc component names

CONF_VIPROC_SAVE_REFERENCE_IMAGE

Tag code	NumDes	Message	SNMP Support
0x0805	video line	no	no
Datatype	Access Level	Description	
Read	f_flag	access_right_minimal	not supported
Write	f_flag	access_right_service	triggers the VCA to create a reference image, but only if possible (e.g. not a dome camera)

CONF_VIPROC_REFERENCE_IMAGE_FILENAME

Tag code	NumDes	Message	SNMP Support
0x0806	video line	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	reads the current reference image filename
Write	p_string	access_right_service	not supported

CONF_START_VIPROC_CONFIG_EDITING

Tag code		NumDes	Message	SNMP Support
0x0a38		video line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	not supported	
Write	t_dword	access_right_service	Moves to the dome to the scene corresponding to the specified config and freezes the dome there. If already a config is in configuration mode, this command returns with a dword of 0. All subsequent viproc commands are related to this configuration. This command works also for non-dome devices. There it won't try to move the dome to the corresponding scene.	

CONF_STOP_VIPROC_CONFIG_EDITING

Tag code		NumDes	Message	SNMP Support
0x0a39		video line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	not supported	
Write	t_dword	access_right_service	Stops editing of the specified config (see CONF_START_VIPROC_CONFIG_EDITING). If the specified scene does not match the currently edited config, a dword with value 0 is returned.	

CONF_CONT_VIPROC_CONFIG_EDITING

Tag code		NumDes	Message	SNMP Support
0x0a3a		video line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	not supported	
Write	t_dword	access_right_service	Configuration of a config stops automatically after 20 seconds. This command can be used to keep configuration active for another 20 seconds. If the specified config is currently not in configuration mode, the command replys with a dword of 0.	

CONF_VIPROC_SCENE

Tag code	NumDes	Message	SNMP Support
0x0a3b	video line	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	returns the scene for which the active config is defined.
Write	t_dword	access_right_service	writes the scene number of the active viproc configuration

CONF_NUMBER_OF_VIPROC_CONFIGS

Tag code	NumDes	Message	SNMP Support
0x0a3c	video line	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of configurations for the specified line.
Write	t_dword	access_right_service	-

CONF_VIPROC_DEFAULT_LIST

Tag code	NumDes	Message	SNMP Support
0x0cba	video line	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	List of available IVA default configuration sets, value: string ... eg, 0=default 1=line_crsossing.iva 2=inside_field.iva
Write	p_string	access_right_service	write not suported

CONF_VIPROC_DEFAULT

Tag code		NumDes	Message	SNMP Support
0x0cbb		video line	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	read not supported	
Write	t_octet	access_right_service		

Payload Structure

This commands deploys a dedicated config file to set VCA config. The list of available scenario defaults can be retrieved with the command VIPROC_DEFAULT_LIST. In case of an error this command may return with a command specific error code. For a list of the specific error code see below. The value associated to scenario will be kept constant.

Defaults Scenarios

- 0 default
- 1 Intrusion (one field)
- 2 Intrusion (two fields)
- 3 People counting
- 4 Traffic incidents
- 5 Traffic wrong way

Command specific error codes

- 0x01 Default scenario not available
- 0x02 Calibration missing
- 0xF0 Internal error

CONF_ACTIVE_VIPROC_CONFIG

Tag code		NumDes	Message	SNMP Support
0x0a3f		video line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the config id activated by bool engine.	
Write	t_dword	access_right_service	Sets the specified config ID as active. The command has only an effect, if the VIPROC_MODE is set to SCRIPT mode (0xff). this command is not available on a gen4 dome.	

CONF_LOADED_VIPROC_CONFIG

Tag code		NumDes	Message	SNMP Support
0x0a3d		video line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the currently loaded config id.	
Write	t_dword	access_right_service	cannot be written.	

CONF_VIPROC_CONFIG_NAME

Tag code		NumDes	Message	SNMP Support
0x0a40		video line	no	no
Datatype		Access Level	Description	
Read	p_unicode	access_right_minimal	returns the name of the currently active viproc configuration.	
Write	p_unicode	access_right_service	writes the name of the currently active viproc configuration. The name can have at most 15 unicode characters.	

CONF_LIST_OF_VIPROC_SCENES

Tag code		NumDes	Message	SNMP Support
0x0a41		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	this command works only for Gen4 autodomes. It returns the list of defined scenes together with their names. Thereby the first byte specifies the scene number, followed by the length L of the scene name. The next L bytes belong to the scene name in unicode without 0 termination. This structure repeats until either the payload ends or the scene number is zero.	
Write	t_dword	access_right_service	-	

CONF_VIPROC_TAGGED_CONFIG

Tag code		NumDes	Message	SNMP Support
0x0a42		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read a list of viproc items in an atomar way. see detailed description .	
Write	p_octet	access_right_service	writes any viproc commands in an atomar way. see detailed description .	

The payload has a tag structure which is as follows:

where Config ID is an integer between 1 and the maximum number of configurations available for this line (this maximum number can be retrieved by the command `CONF_NUMBER_OF_VIPROC_CONFIGS`).

The num value of the RCP command selects the video line to which the configuration belongs.

For a write operation, the payload of tags must fit the size of the corresponding items. If this is not the case, the command will fail. If the `CONF_VIPROC_CUSTOM_PARAMETERS` and `CONF_VCD_OPERATOR_PARAMS` items are written for the currently active configuration, they are checked by the currently active `viproc` and `ruleengine` algorithms. If they are not accepted, the corresponding algorithm is set to default mode and the default parameters are put into the reply. To summarize, a write operation is successful, if the `RCP+ command` succeeds and the reply payload is identical to the request payload.

CONF_VIPROC_DLL_NAME
CONF_VIPROC_ONOFF
CONF_VIPROC_SCENE
CONF_VIPROC_CONFIG_NAME
CONF_VIPROC_CUSTOM_PARAMETERS
CONF_VCD_OPERATOR_PARAMS
CONF_VIPROC_ALARM_MASK
CONF_VIPROC_ALARM_AGGREGATION_TIME
CONF_VIPROC_MOTION_DEBOUNCE_TIME

The payload of a tag must be in network byte-order.

4				6				8				15				17				19				20				24			
Config ID 4 Bytes				Tag1 2 Bytes		Length1 2 Bytes		Payload1 7 Bytes				Tag2 2 Bytes		Length2 2 Bytes		Payload2 1 Byte				0 4 Bytes											
0x00	0x00	0x00	0x01	0x08	0x04	0x00	0x07	"vipro"				0x08	0x00	0x00	0x01	0x01				0x00	0x00	0x00	0x00								
RCP Payload N Bytes																															

CONF_VIPROC_TAGGED_CONFIG_INTERNAL

Tag code		NumDes	Message	SNMP Support
0x0a43		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read a list of viproc items in an atomar way.	
Write	p_octet	access_right_internal	writes any viproc commands in an atomar way.	

CONF_VIPROC_ALARM

Tag code	NumDes	Message	SNMP Support
0x0807	video line	yes	yes
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	not supported

Payload Structure

Alarm Flags	Detector Flags	ConfigId
2 Byte	2 Byte	1 Byte
8	24	40

The message is sent whenever any of the bit values changes. Additionally it is sent once per 10 seconds when any of the bits is set.

Alarm Flags

Values:

0x8000	default task
0x4000	global change flag
0x2000	signal too bright flag
0x1000	signal too dark flag
0x0800	reserved
0x0400	image too blurry flag
0x0200	signal loss flag
0x0100	reference image check failed flag
0x0080	invalid configuration flag
0x0040	flame detection flag
0x0020	smoke detection flag

These bits can be combined by using the bitwise or-operator.

Detector

State of the detectors. 0x0001 corresponds to detector one, 0x0002 to detector two and so on.

ConfigId

Identification number of the VCA profile caused this alarm.

CONF_ALARM_OVERVIEW

Tag code	NumDes	Message	SNMP Support
0x0c38	video line (starts with 1)	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	not supported

Payload Structure

16			32	
Flags 1 Byte	Reserved 1 Byte	Number of alarm entries 2 Byte		
Alarm Entry n Byte				
...				
Alarm Entry n Byte				

Messages are sent if a change has happened (event, state change, alarm added, alarm deleted). The readout command contains all registered alarm entries.

Flags

Values:

0x80 All entries included (read out)

Alarm Entry

16		32	
Entry ID		Entry Length	
2 Byte		2 Byte	
Flags	Reserved	Alarm Source	Alarm Type
1 Byte	1 Byte	1 Byte	1 Byte
Alarm Name			
n Byte			
8		24	

Entry ID

Unique ID for each entry. May be reassigned to entry if entry is deleted.

Entry Length

Length of the entry payload, exclusive header.

Flags

Values:

0x80 Add Flag Alarm Entry has been registered

0x40 Delete Flag Alarm Entry has been unregistered

0x20 State Flag Alarm Entry is a state

0x10 State Set Flag Alarm Entry State is set (states only)

Alarm Source

Values:

0 unknown

2 Relais

3 Digital Input

4 Audio

5 Virtual Input

6 Tamper

7 Motion

8 Flow

9 Intelligent Video Analytics

10 Fire

11 Man Over Board

Alarm Type

Values:

0 unknown

1 VCA

2 Relais

3 Digital Input

4 Audio

5 Virtual Input

16 Default Task

17 Global Change

18 Signal too bright

- 19 Signal too dark
- 23 Reference Image Check Failed
- 24 Invalid Configuration
- 25 Flame Detected
- 26 Smoke Detected
- 32 Object in field
- 33 Crossing line
- 34 Loitering
- 35 Condition change
- 36 Following route
- 37 Tampering
- 38 Removed object
- 39 Idle object
- 40 Entering field
- 41 Leaving field
- 42 Similarity search
- 43 Crowd detection
- 44 Flow in field
- 45 Counter flow in field
- 46 Motion in field
- 47 Man over board
- 48 Counter
- 49 BEV People Counter
- 50 Occupancy

Alarm Name

String encoded in unicode.

CONF_AUPROC_ALARM

Tag code		NumDes	Message	SNMP Support
0x0a79		audio line	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Message only,	
Write	p_octet	access_right_service	-	

Payload Structure

Alarm Flags

The message is sent whenever any of the bit values changes. Additionally it is sent once per second when any of the bits is set.

Values:

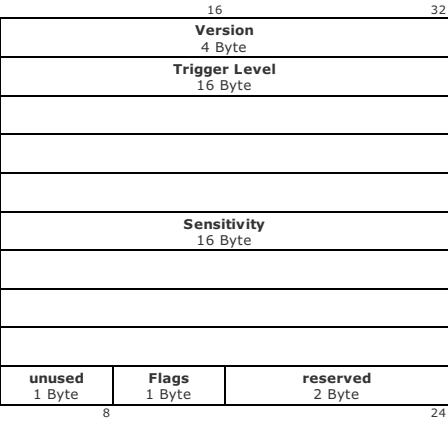

Bit01	Frequency band 0-220 Hz
Bit02	Frequency band 110-360 Hz
Bit03	Frequency band 220-500 Hz
Bit04	Frequency band 360-690 Hz
Bit05	Frequency band 500-890 Hz
Bit06	Frequency band 690-1110 Hz
Bit07	Frequency band 890-1375 Hz
Bit08	Frequency band 1110-1690 Hz
Bit09	Frequency band 1375-2030 Hz
Bit10	Frequency band 1690-2420 Hz
Bit11	Frequency band 2030-2875 Hz
Bit12	Frequency band 2420-3400 Hz
Bit13	Frequency band 2875-4000 Hz
Bit14	Entire frequency band

Bit15-32 are unused and should be zero.

CONF_AUPROC_CONFIG

Tag code	NumDes	Message	SNMP Support
0x0a7a	yes (audio line)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read configuration of AUPROC
Write	p_octet	access_right_service	write configuration of AUPROC

Payload Structure

Description

This command configures the audio alarm analysis. The analysis is based on a 8kHz signal (if the device supports higher sampling rates the signal is downsampled). The analysed frequency bands (there are 13 frequency bands) have the following center frequencies:
100 Hz, 220 Hz, 350 Hz, 500 Hz, 680 Hz, 880 Hz, 1.1 kHz, 1.4 kHz, 1.7 kHz, 2.0 kHz, 2.4 kHz, 2.9 kHz, 3.4 kHz
The freuqnecy bands are overlapping triangles.

Version

Unused (should be zero).

Trigger Level

16 Values between 0 and 255 (1 Byte each), setting the fixed threshold for every frequency band and energy level.
First Byte is for the lowest frequency and the last for the energy level. Trigger level 0 indicates that this frequency band is set off.
14 bytes (13 bands plus entire energie) are used in this version (refer to AUPROC_ALARM command).

Sensitivity

16 Values between 1 and 100 (1 Byte each), setting the sensitivity for every frequency band and energy level.
First Byte is for the lowest frequency and the last for the energy level.
14 bytes (13 bands plus entire energie) are used in this version.
The sensitivity is based on an adaptive threshold and a sliding window.

Flags

1 Byte for flags is reserved. The highest bit indicates audio alarm onoff.

Values:	
Bit 8	OnOff flag

CONF_AUPROC_MELPEGEL

Tag code	NumDes	Message	SNMP Support
0x0a7b	yes (audio line)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read the recent pegel in the frequency bands: detailed decription
Write	p_octet	access_right_service	not supported

Payload Structure

16	32
recent melpegel	
14 Byte	
adaptive threshold level	
14 Byte	

Each of the 14 bytes corresponds to the frequency bands described within the command AUPROC_ALARM.

CONF_AUPROC_NAME

Tag code	NumDes	Message	SNMP Support
0x0a7c	audio line	no	no
Datatype	Access Level	Description	
Read	p_unicode	access_right_minimal	-
Write	p_unicode	access_right_service	-

CONF_VIPROC_ALARM_MASK

Tag code	NumDes	Message	SNMP Support
0x0a23	video line	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read which of the 32 bits produced by the viproc+ruleengine are considered for the CONF_VIPROC_ALARM. see CONF_VIPROC_ALARM for the meaning of the 32 bits.
Write	p_octet	access_right_service	configures which of 32 bits produced by the viproc+ruleengine are considered for the CONF_VIPROC_ALARM see CONF_VIPROC_ALARM for the meaning of the 32 bits.

CONF_VIPROC_CONFIG_CHANGE_IN_RECORDING

Tag code	NumDes	Message	SNMP Support
0x0a60	video line	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	If the recording module detects a viproc configuration change, it sends this message. The payload of the message has the following structure: 8 Bytes - UTC timestamp int Time64 format, 1 Byte - config ID, 16 Bytes - MD5 Hash of the configuration.
Write	p_octet	access_right_service	-

CONF_VIPROC_MODE

Tag code		NumDes	Message	SNMP Support
0x0a65		video line	no	yes
Datatype		Access Level	Description	
Read	octet	access_right_minimal	switches between silent vca(0)/manual(1..16)/off(0xfd)/scheduler(0xfe)/script mode(0xff) of the video content analysis (VCA). In case of a moving dome and a preset with activated VCA profile the active id is returned. (if vca is turned off then 0xfd is returned).	
Write	octet	access_right_service	switches between silent vca(0)/manual(1..16)/off(0xfd)/scheduler(0xfe)/script mode(0xff) of the video content analysis (VCA). Command should not be used while configuring a profile (i.e. start_viproc_config_editing is active). On the gen4 dome, the modes 0xfe and 0xff are not supported. Any value between 0 and 16 is interpreted as on and 0xfd as off.	

CONF_VIPROC_WEEKLY_SCHEDULE

Tag code		NumDes	Message	SNMP Support
0x0a66		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Returns the weekly VCA schedule of the specified line. The format of the payload is the same as the one of the CONF_HD_RECORD_SCHEDULE command.	
Write	p_octet	access_right_service	Sets the weekly VCA schedule of the specified line. The format of the payload is the same as the one of the CONF_HD_RECORD_SCHEDULE command.	

CONF_VIPROC_HOLIDAYS_SCHEDULE

Tag code		NumDes	Message	SNMP Support
0x0a67		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Returns the holidays VCA schedule of the specified line. The format of the payload is the same as the one of the CONF_HD_RECORD_HOLIDAYS command.	
Write	p_octet	access_right_service	Sets the holidays VCA schedule of the specified line. The format of the payload is the same as the one of the CONF_HD_RECORD_HOLIDAYS command.	

CONF_PTZ_CONTROLLER_AVAILABLE

Tag code	NumDes	Message	SNMP Support
0x0a51	video line	no	no
Datatype	Access Level	Description	
Read	flag	access_right_minimal	returns true if for the specified line a ptz controller is available which can be used by the VCA module.
Write	flag	access_right_service	not supported

CONF_ENABLE_VCA

Tag code	NumDes	Message	SNMP Support
0x0813	video line	no	no
Datatype	Access Level	Description	
Read	flag	access_right_minimal	This command is used to configure the dome. Note that we write the information in the second bit of ptz_controller_available.
Write	flag	access_right_service	not supported

CONF_VIPROC_ALARM_AGGREGATION_TIME

Tag code	NumDes	Message	SNMP Support
0x0aca	video line	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	obsolete, please use VIPROC_ALARM_EXT_AGGREGATION_TIME.
Write	t_octet	access_right_service	obsolete, use VIPROC_ALARM_EXT_AGGREGATION_TIME.

CONF_VIPROC_ALARM_EXT_AGGREGATION_TIME

Tag code	NumDes	Message	SNMP Support
0x0ba7	video line	no	no
Datatype Access Level Description			
Read	p_octet	access_right_minimal	read the alarm aggregation time of the video line (unit is 0.1 seconds, thus, 16 corresponds to 1.6 seconds). The return value has to bytes is a word beginning with the upper byte and followed by the lower byte.
Write	p_octet	access_right_service	write the duration of the alarm aggregation time in 0.1 seconds (1.6 sec corresponds to a value 16). The payload consists of an upper and a lower byte resulting in a maximal time of 6553.6 seconds. Note, this parameter belongs to a viproc config.

CONF_VIPROC_MOTION_DEBOUNCE_TIME

Tag code	NumDes	Message	SNMP Support
0x0acb	video line	no	no
Datatype Access Level Description			
Read	t_octet	access_right_minimal	read the motion alarm debounce time of the video line (4,3s == 43). Note, this parameter belongs to a viproc config.
Write	t_octet	access_right_service	write the duration of the motion alarm debounce time of the video line (1,6sec == 16). Note, this parameter belongs to a viproc config.

CONF_VCA_TASK_RUNNING_STATE

Tag code	NumDes	Message	SNMP Support
0x0a96	yes (camera line input number)	yes	no
Datatype Access Level Description			
Read	flag	access_right_minimal	returs the current processing state of the VCA engine; TRUE when vca engine is running with no problems; FALSE if vca engine lack cpu performance
Write	-	access_right_service	not supported

CONF_VIPROC_VERSION

Tag code		NumDes	Message	SNMP Support
0x0ab2		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	viproc interface version on FPGA VCA devices	
Write	p_octet	access_right_service	viproc interface version on FPGA VCA devices	

CONF_TRANSPARENT_DATA_OVER_IP

Tag code		NumDes	Message	SNMP Support
0x0af2		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	set IP-address and port to accept transparent data, first, 4 bytes define the IP-address (0 represents off) and second, two bytes are the defined port	
Write	p_octet	access_right_service	set IP-address and port to accept transparent data, first, 4 bytes define the IP-address (0 represents off) and second, two bytes are the defined port	

CONF_AUTO_TRACKER_TRACK_OBJECT

Tag code		NumDes	Message	SNMP Support
0x0b2d		video line (starts with 1)	yes	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	Get the object id of the currently tracked object. Zero is returned if no object is tracked.	
Write	t_dword	access_right_user	send the object id to start tracking	

CONF_AUTO_TRACKER_TRACK_OBJECT_POS

	Tag code	NumDes	Message	SNMP Support
	0x0c28	video line (starts with 1)	no	no
	Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	not supported	
Write	p_octet	access_right_user	send an image position to start tracking the nearest object. Position is in normalized coordinate system with upper left corner (0x0000 0x0000) and lower right corner (0x8000 0x8000)	

CONF_MODE_AUTO_TRACKER

	Tag code	NumDes	Message	SNMP Support
	0x0b40	video line (starts with 1)	yes	no
	Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	Get the autotracker mode (Modi: OFF=0, AUTO=1, CLICK=2).	
Write	t_octet	access_right_user	Sets the autotracker mode (Modi: OFF=0, AUTO=1, CLICK=2). The CLICK mode has to be rewritten after 10sec; otherwise, the mode shall switch back to AUTO	

CONF_STATUS_AUTO_TRACKER

	Tag code	NumDes	Message	SNMP Support
	0x0b86	-	yes	no
	Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	Gets current mode of auto tracker. 0=off; 1=idle; 2=seeking; 3=tracking active; 4=tracking passive	
Write	t_octet	access_right_user	Gets current mode of auto tracker.	

CONF_SENSITIVITY_OBJECT_BASED_VCA

Tag code		NumDes	Message	SNMP Support
0x0b31		video line	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	reads the sensitivity of the object based VCA algorithm (of active config profile), if not an object based VCA algorithm is running the command returns with an error	
Write	t_octet	access_right_service	sets the sensitivity of the object based VCA algorithm in the active config profile, if not an object based VCA algorithm is running the command returns with an error	

CONF_VIPROC_SENSITIVE_AREA

Tag code	NumDes	Message	SNMP Support
0x0b78	video line	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	sets the sensitive area of the object based VCA algorithm in the active (or last loaded) config profile, see detailed description
Write	p_octet	access_right_service	sets the sensitive area of the object based VCA algorithm in the active (or last loaded) config profile

Payload Structure

This command reads/sets the sensitivity mask of the viproc algorithm. Please use the read functionality to get the dimensions. If no viproc algorithm is running the command fails.

Width

Image width of the viproc algorithm.

Height

Image height of the viproc algorithm.

Cells X/Y

Number of cells in X/Y direction.

Step X/Y

Number of cell size in X/Y direction.

Start X/Y

Offset of bit mask from upper left corner.

Bitmask

Bitstream which signals which cell is activated or not. Upper left cell is the first going to the left and then down.

Example: A 3x3 mask with cross activated

```
OXO
XXX
OXO
```

has the following binary 0x010111010b or hexadecimal 0xba00h structure. Alignment bits can be set to zero but will be ignored.

CONF_REFERENCE_IMAGE_CHECK_INFO_MESSAGE

Tag code		NumDes	Message	SNMP Support
0x0b42		video line	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	1st Byte (Bit 7: check failed, Bit 6: No info available (reference image check was not enabled or reference image has not enough contours to perform reference image check), Bits 5-0: reserved), 2nd Byte: correlation, 3rd Byte: correlation threshold, 4th-5th Byte: seconds to alarm;	
Write	p_octet	access_right_service	not supported	

CONF_IVA_COUNTER_VALUES

Tag code	NumDes	Message	SNMP Support
0x0b4a	video line	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	reset all counters

This command, which is at the same time a message, is used to retrieve the list of configured counters with the their current values. The output has the following structure: Initially the number of configured counters is set. Afterwards for each counter the data consisting of counter id, counter type, counter name in unicode and counter value is provided.

Request payload structure

Number of Counters 1 Byte
Data of Counter i 70 Byte
Data of Counter i + 1 70 Byte
... 70 Byte

Number of Counters

This values gives the number of counters available in the payload. In the subsequent the data of each counter are sequentially provided.

Data of Counter

16			
Id 1 Byte	Type 1 Byte	Name 64 Byte	Value 4 Byte
8		528	

Id

Each counter has a unique id.

Type

Not supported yet.

Name

A unique name can be assigned to a counter, which is stored in unicode (maximum: 32 characters).

Value

The current counter value (DWORD).

CONF_BEST_FACE

Tag code	NumDes	Message	SNMP Support
0x0b6e	video line	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_service	

Payload Structure

16		32	
enable 1 Byte	reserved 1 Byte	accountId 1 Byte	pictureFormat 1 Byte
targetObjectWidth 4 Bytes			
time out 1 Byte	reserved 1 Byte	reserved 1 Byte	reserved 1 Byte
reserved 8 Bytes ...			
8		24	

enable

0: best face is disabled 1: best face is enabled

reserved

Must be written as zero

accountId

Select account which is used as target for the detected faces for detailed information's see CONF_ACCOUNT_SETTINGS

pictureFormat

Select file format 0: Jpeg 1: YUV420 2: uncompressed tiff

targetObjectWidth

Configure maximum face width in pixel 0 means auto no scaling is necessary delivers best performance

time out

Time out in seconds. If the time out is set to 0 the best face of the tracking process will be posted when the face has left the scene.

Defines a timeout for the maximum delay which is introduced till a face is posted. After a face is posted the tracking is restarted.

Example:

Face is in scene for 50 sec t = [0s,50s]

timeout is configured to 10 s

best face of [0s,10s] is posted

best face of [10s,20s] is posted

best face of [20s,30s] is posted

best face of [30s,40s] is posted

best face of [40s,50s] is posted

reserved

Must be written as zero

CONF_BEST_FACE

Allows the upload of detected faces to an ftp server or drop box account.

CONF_WRITE_XML_TO_VCD

Tag code		NumDes	Message	SNMP Support
0x0baf		video line	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	not supported	
Write	p_string	access_right_service	write payload to vcd stream within a XML VCD-tag, data can be refound in VCD layer 0 and VCD layer 14. The reply is a UTC time (first 4 bytes are the seconds since 2000 followed by two bytes residual milliseconds). The payload is limited to 1400 bytes. A very simple xml validation is performed -> tags can only have 31 bytes length and nesting is limited, CDATA is not allowed. Everything before the first xml element and after the last xml element is skipped. Only utf 8 encoding is supported.	

CONF_SCHEDULED_PTZ_PROFILES

Tag code	NumDes	Message	SNMP Support
0x0c1f	cam 1 ... n	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read scheduled ptz profiles of one cam, see detailed description
Write	p_octet	access_right_service	write scheduled ptz profiles of one cam, see detailed description

Payload Structure

PTZ Profile 1 - 10

Upto 10 Scheduled PTZ profiles (at least 1) for the camera specified by the num parameter, see detailed description for a scheduled PTZ profile

SCHEDULED_PTZ_PROFILES

Read/Write upto ten scheduled ptz profiles (at least one) for a camera, payload upto 80 bytes total. The profiles will be written to the config. Based on the record schedule the profiles will become active and a PTZ/ROI Tour/Preset will be activated or deactivated. The flag SCHEDULED_PTZ_PROFILE_FLAG_TOUR, will use a PTZ tour on PTZ domes. If the cam isn't a PTZ camera, ROI is used instead, if the line is capable of it. The preset/tour will be applied on changes only, except the SCHEDULED_PTZ_PROFILE_FLAG_RETRIGGER flag is set, this will repeat the apply periodically. An User will be always able to change the PTZ state on a camera after the scheduled apply.

scheduled PTZ profile structure

PTZ/ROI Preset/Tour 2 Byte	flags 1 Byte	reserved 1 Byte
reserved 4 Bytes		

PTZ/ROI Preset/Tour

number of a preset or tour for PTZ or ROI depending on the flags settings, if the tourflag is set, following values are defined, 1 - Tour A, 2 - Tour B, 3 - Custom Tour

flags

Flags:

SCHEDULED_PTZ_PROFILE_FLAG_TOUR	0x01	if set, the preset number specifies a PTZ tour (only for PTZ domes)
SCHEDULED_PTZ_PROFILE_FLAG_RETRIGGER_LOCK	0x02	if set, the preset (not tour) setting will be reapplied about every 10th second and ptz from user will be locked for both tour and preset (except bicom aux)

CONF_SCHEDULED_PTZ_PROFILE

Tag code	NumDes	Message	SNMP Support
0x0c20	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read one scheduled ptz profile, see detailed description
Write	p_octet	access_right_service	write one scheduled ptz profile, see detailed description

Payload Structure

Command Header 4 Bytes
PTZ Profile 8 Bytes
...

Command Header

Command header specifies the requested PTZ Profile, see detailed description for command header

PTZ Profile

One PTZ profiles for the camera specified by the command header, see detailed description for a scheduled PTZ profile

SCHEDULED_PTZ_PROFILE

Read/Write one scheduled ptz profiles for a camera, payload upto 12 bytes total. The profiles will be written to the config. Based on the record schedule the profiles will become active and a PTZ/ROI Tour/Preset will be activated or deactivated. The flag SCHEDULED_PTZ_PROFILE_FLAG_TOUR, will use a PTZ tour on PTZ domes. If the cam isn't a PTZ camera, ROI is used instead, if the line is capable of it. The preset/tour will be applied on changes only, except the SCHEDULED_PTZ_PROFILE_FLAG_RETRIGGER flag is set, this will repeat the apply periodically. An User will be always able to change the PTZ state on a camera after the scheduled apply. In read direction only the command header (4 bytes) is required. The response will have the full payload size of 12 bytes including the PTZ profile.

Command Header

Camera 2 Byte	reserved 1 Byte	Profile 1 Byte
16	8	32
	24	

Camera

Camara line of the requested PTZ profile (1 to n)

Profile

Profile number of the requested PTZ profile (1 to 10)

scheduled PTZ profile structure

PTZ/ROI Preset/Tour 2 Byte	flags 1 Byte	reserved 1 Byte
16	8	32
reserved 4 Bytes		
24		

PTZ/ROI Preset/Tour

number of a preset or tour for PTZ or ROI depending on the flags settings, if the tourflag is set, following values are defined, 1 - Tour A, 2 - Tour B, 3 - Custom Tour

flags

Flags:

SCHEDULED_PTZ_PROFILE_FLAG_TOUR	0x01	if set, the preset number specifies a PTZ tour (only for PTZ domes)
SCHEDULED_PTZ_PROFILE_FLAG_RETRIGGER_LOCK	0x02	if set, the preset (not tour) setting will be reapplied about every 10th second and ptz from user will be locked for both tour and preset (except bicom aux)

8	24	

Status

<u>Values:</u>	
Sealing off	0
Sealing on and seal valid	1
Sealing on and seal broken	2

Reserved

Reserved, should be ignored

Values:

SealSetTimestamp

Timestamp when seal was activated in seconds since year 2000

SealRandom

Random number generated once when seal was activated

Values:

SystemTimestamp

Current system time in seconds since year 2000

Values:

Sealing concept

The system can be set up in a way that unexpected configuration changes on the device cause a alert message, even when the user uses a valid login and password for this action.

To achieve this:

After the hole system configuration is completed CONFIG_SEALING_ENABLED need to be set to 1 (= Seal enabled).

In this state each critical configuration change causes the device to send a CONFIG_SEALING_STATUS message.

If a client wants to active verify if a seal is valid then it should read CONFIG_SEALING_STATUS

Then it should check its content for:

- Status = 1 (Sealing valid)
- SealSetTimestamp if the time contained here lies before the date of the last known installation change.
- SystemTimestamp if it is about the actual local time (to protect against time manipulation on the SealSetTimestamp)

CONF_CLOUD_WATCH_SETTINGS

Tag code	NumDes	Message	SNMP Support
0x0cd6	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns cloud watch settings of the device in a tagged format

Read	Datatype	Access Level	Description
	p_octet	access_right_live	
Write	p_octet	access_right_service	

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes -4	
16	32

Generic description

The format has an internal tagged structure, the allowed tags can be queried via CONF_CAMERA_POSITION_OPTIONS (Byte[0] support local cartesian coordinate system [0 no, 1 yes]); 1 -> tag 1 and 2 are suported (Byte[1] support wgs 1984 coordinate system [0 no, 1 yes]) 1 -> tag 3 and 4 are suported

Only a single set of coordinates can be used e.g. local coordinates or global WGS coordinates it is possible to define the coordinates via a string or a binary command Tag 1 (binary) and 3 (string) configure a local cartesian coordinate system. Tag 2 (binary) and 4 (string) configure a wgs 1984 coordinate system.

Read will always return both variant of one configuration (string + binary representation)

Tags

Camera position undefined: 0

Default value when no camera position is configured can also be used to remove the camera position configuration

length = 4 2 Byte	tag = 0 2 Byte
16	32

Tags

Local cartesian camera position (binary): 1

length = 16 2 Byte	tag = 1 2 Byte
X 4 Bytes	
Y 4 Bytes	
Z 4 Bytes	
16	32

X, Y, Z s(32): specify the position of the camera in a local cartesian coordinate system in units of 1/(2^16) m

Tags

Local cartesian camera position (string): 3

length = 4+n 2 Byte	tag = 3 2 Byte
X;Y;Z n Bytes	
16	32

X, Y, Z (string: 5.4;5.4;5.4): specify the position of the camera in a local cartesian coordinate system max: 32767 m min: -32767 m Example: XYZ = "1000.124;145.3434;123.2355" -> x= 1000.124 m, y = 145.3434 m, z = 123.2355

Tags

WGS 1984 camera position (binary): 2

Define the camera position based on wgs 1984 (World Geodetic System 1984)

length = 24 2 Byte	tag = 2 2 Byte
longitude [64:32] 4 Bytes	
longitude [31:0] 4 Bytes	
latitude [64:32] 4 Bytes	
latitude [31:0]	

<div>4 Bytes</div> <div>height</div> <div>4 Bytes</div>

16

32

longitude u(64): Specifies the longitude in units of $(2 \cdot \pi / (2^{64}))$
latitude u(64): Specifies the latitude in units of $(2 \cdot \pi / (2^{64}))$
height s(32): Signed value height above sea level in units of $1 / (2^{16})$ m

Tags

WGS 1984 camera position (string): 4

Define the camera position based on wgs 1984 (World Geodetic System 1984)

<div>length = 4+n</div> <div>2 Byte</div>	<div>tag = 4</div> <div>2 Byte</div>
<div>longitude;latitude;height</div> <div>n Bytes</div>	

16

32

longitude,latitude,height string(3.12;3.12;5.4): Specifies the longitude, latitude in degree
allowed values are [-360.0...0.0...360]
also the height above sea level is defined limits are (max: 32767 m min: -32767)
Example: longitude;latitude;height="12.45674964;45.456464;125.1234"
-> longitude = 12.45674964°, latitude = 45.456464°, 125.1234 m

pan 4 Bytes	
16	32

pan u(32): Specifies the pan angle in units of (2*pi/(2^32))

Tags

Camera orientation configuration via string, only pan angle can be configured (legacy mode: Plane is configured via VCA config): 3

length = 4+n 2 Byte	tag = 3 2 Byte
pan n Bytes	
16	32

pan string (string 3.6): Specifies the pan angle (in degrees) as a string allowed values are [-360.0...0.0...360.0]
Example string:
pan="3.455"
-> pan = 3.455°

Tags

Full camera orientation configuration: 2

length = 16 2 Byte	tag = 2 2 Byte
pan 4 Bytes	
tilt 4 Bytes	
roll 4 Bytes	
16	32

pan u(32): Specifies the pan angle in units of (2*pi/(2^32))
tilt u(32): Specifies the tilt angle in units of (2*pi/(2^32))
roll u(32): Specifies the roll angle in units of (2*pi/(2^32))

Tags

Full camera orientation configuration (via string): 4

length = 4+n 2 Byte	tag = 4 2 Byte
pan;tilt;roll n Bytes	
16	32

pan string (string: 3.6;3.6;3.6): Specifies the pan;tilt;roll angle (in degrees) as a string allowed values are [-360.0...0.0...360.0]
Example string:
pan;tilt;roll="1.1456;145.455;14.01"
-> pan = 1.1456°, tilt = 145.455°, roll = 14.01°

CONF_CAMERA_POSITION_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0be0		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Byte[0] support local cartesian coordinate system [0 no, 1 yes]; Byte[1] support wgs 1984 coordinate system [0 no, 1 yes]; Byte[2] support orientation calibration[0 no support, 1 pan only, 2 full support]; Byte[3-7]reserved	
Write	p_octet	access_right_service	not supported	

CONF_CAMERA_SURROUNDING

Tag code	NumDes	Message	SNMP Support

Datatype	Access Level	Description	
Read	p_octet	access_right_live	
Write	p_octet	access_right_service	

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes -4	

16

32

Generic description

The format has an internal tagged structure, the allowed tags can be queried via CONF_CAMERA_SURROUNDING_OPTIONS
([0: no, 1: flat plane only elevation can be configured (plane is assumed to be parallel to the (world, local) coordinate system)])
1 -> Tag 1 (binary) and 3 (string) configure a offset to the ground plane (orientation is derived from (CONF_CAMERA_ORIENTATION))

Only a single surrounding configuration
it is possible to define the coordinates via a string or a binary command
Tag 1 (binary) and 3 (string) configure a elevation to the ground plane under the assumption that the ground plane
is parallel to the camera surrounding defined by (CONF_CAMERA_POSITION and CONF_CAMERA_ORIENTATION)
surrounding is defined by CONF_CAMERA_ORIENTATION [tilt, roll] + CONF_CAMERA_SURROUNDING [elevation]
Read will always return both variant of one configuration (string + binary representation)

Tags

Camera surrounding undefined: 0

Default value when no camera surrounding is configured, can also be used to remove the camera surrounding configuration

length = 4 2 Byte	tag = 0 2 Byte
----------------------	-------------------

16

32

Tags

Camera ground model plane is parallel to coordinate system defined by (CONF_CAMERA_POSITION and CONF_CAMERA_ORIENTATION)(binary): 1

length = 8 2 Byte	tag = 1 2 Byte
elevation 4 Bytes	

16

32

elevation s(32): specify the elevation relativ to the ground plane in units of 1/(2^16) m

Tags

Camera ground model plane is parallel to coordinate system defined by (CONF_CAMERA_POSITION and CONF_CAMERA_ORIENTATION) (string): 3

length = 4+n 2 Byte	tag = 3 2 Byte
elevation n Bytes	

16

32

elevation(string; 5.4): specify the position of the camera in a local cartesian coordinate system max: 32767 m min: -32767 m
Example:
elevation = "1000.124"
-> elevation= 1000.124 m

CONF_CAMERA_SURROUNDING_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0be2		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Byte[0] support plane as surrounding model[0: no, 1: flat plane only elevation can be configured (plane is assumed to be parallel to the (world, local) coordinate system); Byte[1-7]reserved	
Write	p_octet	access_right_service	not supported	

CONF_CAMERA_LOCATION_METADATA

Tag code	NumDes	Message	SNMP Support
0x0bfa	no	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_user	
Write	p_octet	access_right_service	

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes -4	
16	32

Generic description

Command CONF_CAMERA_LOCATION_METADATA allows to configure/retrieve several descriptive location metadata fields, e.g. City, Country Code. The command has an internal tagged structure.

Tags

City: tag = 0

Contains the city string, no zero termination.

length 2 Byte	tag = 0 2 Byte
city string (length - header) Bytes...	
16	32

Tags

Zip code: tag = 1

Contains the zip code string, no zero termination.

length 2 Byte	tag = 1 2 Byte
zip code string (length - header) Bytes...	
16	32

Tags

Country code: tag = 2

Contains the country code string, no zero termination.

length 2 Byte	tag = 2 2 Byte
country code string (length - header) Bytes...	
16	32

Tags

Region: tag = 3

Specifies the region.

length 2 Byte	tag = 3 2 Byte
region 1 Byte	
16	32

CONF_CAMERA_CALIBRATION

Tag code	NumDes	Message	SNMP Support
0x0c34	video line	no	no
Datatype Access Level Description			
Read	p_octet	access_right_user	calculates calibration with calibration elements, payload is beyond the scope of this document
Write	p_octet	access_right_service	calculates calibration with calibration elements, payload is beyond the scope of this document

CONF_COMPLETE_CALIBRATION_ELEMENT

Tag code	NumDes	Message	SNMP Support
0x0c35	video line	no	no
Datatype Access Level Description			
Read	p_octet	access_right_user	4 bytes reserved, calibration element
Write	p_octet	access_right_service	write not supported

CONF_SHIFT_CALIBRATION_ELEMENT

Tag code	NumDes	Message	SNMP Support
0x0c82	video line	no	no
Datatype Access Level Description			
Read	p_octet	access_right_user	4 bytes reserved, 2 bytes shiftx (0x8000 normalized), 2 bytes shifty (0x8000 normalized), calibration element
Write	p_octet	access_right_service	write not supported

CONF_SENSOR_ORIENTATION

Tag code	NumDes	Message	SNMP Support
0x0c39	IMU Sensor at image sensor: 0x0001-0x00fe; IMU Sensor at chassis: 0x0101 ... 0x01ff; legacy mapping: 0 -> 1, 0xff -> 0x0101, 0x00ff -> 0x0101	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_user	
Write	p_octet	access_right_service	not supported

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes ~4	
16	32

Tagged format

The format has an internal tagged structure with the following tags:

- 1: pan
- 2: tilt
- 3: roll
- 4: rotate
- 5: vector

Missing tags are to be considered as unknown (e.g., no sensor available)

PanTag

Pan angle (magnetic sensor present).

length = 12 2 Byte	tag = 1 2 Byte
pan 4 Bytes	
error_est 4 Bytes	
16	32

pan u(32): Specifies the pan angle in units of (2*pi/(2^32))

error_est u(32): Specifies the estimation error in units of (2*pi/(2^32))

TiltTag

Tilt angle (acceleration sensor present).

length = 12 2 Byte	tag = 2 2 Byte
tilt 4 Bytes	
error_est 4 Bytes	
16	32

tilt u(32) : Specifies the tilt angle in units of (2*pi/(2^32))

error_est u(32): Specifies the estimation error in units of (2*pi/(2^32))

RollTag

Roll angle (acceleration sensor present).

length = 12 2 Byte	tag = 3 2 Byte
roll 4 Bytes	
error_est 4 Bytes	
16	32

roll u(32) : Specifies the roll angle in units of (2*pi/(2^32))

error_est u(32): Specifies the estimation error in units of (2*pi/(2^32))

RotateTag

Image Sensor rotation is active (if tag is missing an unrotated image has to be assumed).

length = 8 2 Byte	tag = 4 2 Byte
rotate 4 Bytes	
16	32

rotate u(32) : Specifies the rotate angle in units of (2*pi/(2^32)). This value can be added to the roll angle.

VectorTag

Acceleration vector (acceleration sensor present).

length = 8 2 Byte	tag = 5 2 Byte
x 4 Bytes	
y 4 Bytes	
z 4 Bytes	
16	32

acceleration vector is given in integer i(32) in milli g

CONF_PREDEFINED_MOUNTING_LIST

Tag code	NumDes	Message	SNMP Support
0x0c76	video line	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_user	contains predefined mounting positions separated by semicolon, last three characters defines the associated tilt angle
Write	p_octet	access_right_service	write not supported

CONF_GETPROFILE_ALGO_PRESET_NAME_LIST

Tag code	NumDes	Message	SNMP Support
0x0c6c	video line	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_user	
Write	p_octet	access_right_service	write not supported

This command returns a list of VCA profile specific information. These information contains the VCA algorithm type, the associated dome preset (if existent otherwise zero) and the profile name.

1	2	4	6	42	
Num Profiles 1 Bytes	Reserved 1 Byte	Algorithm type 2 Byte	Preset 2 Byte	Profile Name 32 Byte	...
	Profile 1			Profile 2	

Algorithm Types

Flag	Name
0x0001	Object Based VCA (IVA, EVA)
0x0002	Flow Based
0x0004	Block Based VCA (Motion)

CONF_COMMISSION_SETUP

Tag code	NumDes	Message	SNMP Support
0x0c6b	no	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_user	returns status of commissioning
Write	p_octet	access_right_service	moves camera to coordinates commissioning

Read:

Payload Structure

0	4	8	12	16	20	24	28	31
Flags 4 Bits	reserved 28 Bits							

Flags

- Bit 0: 1: commissioning available 0: commisioning not available
- Bit 1: 1: running 0: idle
- Bit 2: 1: last command failed 0: last command succeeded, will be set to 0 with each write command
- Bit 3: 1: Is initialized 0: not initialized
- Bit 4-31: reserved, value read is undefined

Write:

Payload Structure

16	32
Flags 4 Bytes	
New view top left x 4 Bytes	
New view top left y 4 Bytes	
New view bottom right x 4 Bytes	
New view bottom right y 4 Bytes	
8	24

General

coordinates are relative in 1/0x8000. Corner top left is (0,0), bottom right is (0x8000,0x8000)
if new view top left coordinate is same as new view bottom right coordinate,
zoom will not be changed, just view is repositioned

Flags

Bit 0 - 31: reserved, write 0

CONF_DEFAULTS

Tag code		NumDes	Message	SNMP Support
0x093d		no	no	yes
Datatype		Access Level	Description	
Read	-	access_right_minimal	not supported	
Write	flag	access_right_service	sets config to default values except IP, subnet and gateway and resets the device. ATTENTION: Wait till board has fully rebooted before switching of power, to ensure that defaults are applied completly. Also propagade this to the user, that he has to wait until the reboot is complete.	

CONF_FACTORY_DEFAULTS

Tag code		NumDes	Message	SNMP Support
0x09a0		no	no	yes
Datatype		Access Level	Description	
Read	-	access_right_minimal	not supported	
Write	flag	access_right_service	set the configuration to factory defaults and reset the board. ATTENTION: Wait till board has fully rebooted before switching of power, to ensure that defaults are applied completly. Also propagade this to the user, that he has to wait until the reboot is complete.	

CONF_BOARD_RESET

Tag code		NumDes	Message	SNMP Support
0x0811		no	no	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	not supported	
Write	flag	access_right_service	reset the board	

CONF_BOOT_DEFAULT_APP

Tag code		NumDes	Message	SNMP Support
0x099f		no	no	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	not supported	
Write	flag	access_right_service	boot the default application	

CONF_VIDEO_ENC_PRIO

Tag code		NumDes	Message	SNMP Support
0x0a81		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	reads the video encoder prioritisation 0:= no, 1:=h26x, 2:=jpeg, 3:=h26x_2nd stream	
Write	t_dword	access_right_service	writes the video encoder prioritisation 0:=no, 1:=h26x, 2:=jpeg, 3:=h26x_2nd stream	

CONF_LED_BLINKING

Tag code		NumDes	Message	SNMP Support
0x013d		no	no	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	always 1	
Write	flag	access_right_minimal	1=power LED will flash for 7 sec	

CONF_JPEG

Tag code		NumDes	Message	SNMP Support
0x099e		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_live	20 byte write payload: byte1: 0=QCIF, 1=CIF, 2=CIF 3=4CIF; byte1:jpeg quality (0 is best); byte2,3 reserved; bytes 4-15: reserved, 16:=borderY, 17:=borderU, 18:= border V, 19:= borderWidth;	
Write	not supported	access_right_live	-	

CONF_CLUSTER_GROUP_SETTING

Tag code		NumDes	Message	SNMP Support
0x09ca		no	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	list of (DWORD ip, DWORD flags, OCTET[6] mac, WORD reserved) cluster members including this unit	
Write	p_octet	access_right_minimal	list of (DWORD ip, DWORD flags, OCTET[6] mac, WORD reserved) cluster members including this unit	

CONF_CLUSTER_ID

Tag code		NumDes	Message	SNMP Support
0x09cb		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the logical position inside a cluster (0=stand alone, >0=slot nbr.)	
Write	t_dword	access_right_service	only in generic: set vrm instance (0 <= ClusterId < 32)	

CONF_APP_OPTION

Tag code		NumDes	Message	SNMP Support
0x09e0		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	DEPRICATED: Use CONF_APP_OPTION_EXT. Returns a bit field containing 256 bits (32 byte). Each bit represents one active license on the device. Bit order is MSB first.	
Write	void	access_right_service	not supported	

CONF_APP_OPTION_EXT

Tag code		NumDes	Message	SNMP Support
0x0c4a		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Returns a bit field containing 512 bits (64 byte). Each bit represents one active license on the device. Bit order is MSB first.	
Write	void	access_right_service	not supported	

CONF_APP_OPTION_UNIT_ID

Tag code		NumDes	Message	SNMP Support
0x09e1		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read out the unique unit id (installation code) for setting application options	
Write	void	access_right_service	not supported	

CONF_APP_OPTION_SET

Tag code		NumDes	Message	SNMP Support
0x09e2		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	returns a readable string with the result code of the last applied set option	
Write	p_string	access_right_service	a key, generated by the license server to enable a specific application option; after entering a key, the APP_OPTION command returns the current activated application options	

CONF_CPU_LOAD_IDLE

Tag code		NumDes	Message	SNMP Support
0x0a06		host=1, coproc=2	no	yes
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	cpu load idle in percent	
Write	t_dword	access_right_service	not supported	

CONF_CPU_LOAD_CODER

Tag code		NumDes	Message	SNMP Support
0x0a07		host=1, coproc=2	no	yes
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	cpu load coder in percent	
Write	t_dword	access_right_service	not supported	

CONF_CPU_LOAD_VCA

Tag code	NumDes	Message	SNMP Support
0x0a08	host=1, coproc=2	no	yes
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	cpu load vca in percent
Write	t_dword	access_right_service	not supported

CONF_STORAGE_LOAD

Tag code	NumDes	Message	SNMP Support
0x0bba	no	no	yes
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	load of local storage in percent
Write	t_dword	access_right_service	not supported

CONF_CPU_LOAD

Tag code	NumDes	Message	SNMP Support
0x0a0a	host=1, coproc=2	no	yes
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	cpu load in percent (byte 0=idle, byte 1 = coder, byte 2=vca, byte 3 LocalRecordingLoad)
Write	p_octet	access_right_service	not supported

CONF_SYSTEM_LOAD

Tag code	NumDes	Message	SNMP Support
0x0cb5	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	recording bitrates:
Write	p_octet	access_right_service	not supported

Payload Structure

length

Length of the tag incuding the 4 header bytes

Values:

Tag

ID of parameter

Values:

Payload

Value of parameter or nested tag

Values:

Tagged format

The format has an internal tagged structure with the following top level tags:

CPU_LOAD_OF_CORE_N	1
RECORDER_N	2

The top level tag CPU_LOAD_OF_CORE_N can contain the following nested tags:

CORE_IDX	3
IDLE_PERC	5
ENC_PERC	6
VCA_PERC	7

The top level tag RECORDER_N can contain the following nested tags:

REC_IDX	4
RECORDING_LOAD_PERC	8
RECORDING_MEDIA_STATUS	9

CPU_LOAD_OF_CORE_N

Container tag which contains information about current CPU-load on a single CPU-core

CORE_IDX

Index of the core described by the current container

IDLE_PERC

Idle value for this core in percent

2 Byte	2 Byte
Percent 0..100	
1 Bytes	
16	32

ENC_PERC

CPU-load in percent caused by the encoder on this core

length = 5	tag = 6
2 Byte	2 Byte
Percent 0..100	
1 Bytes	
16	32

VCA_PERC

CPU-load in percent caused by the VCA on this core

length = 5	tag = 7
2 Byte	2 Byte
Percent 0..100	
1 Bytes	
16	32

RECORDER_N

Container tag which contains information about a local recording media.
The availability of a index in this tag depends on the availability of a media slot on the device, and not on wether a media is currently plugged.
This means: If a device has 2 SD-Card slots then this command always returns 2 descriptors (idx 0,1) also when only one or none card is plugged.

length = 4..n	tag = 2
2 Byte	2 Byte
Nested tags	
0..n Bytes	
16	32

REC_IDX

Index of the media slot, e.g. SD-Card, described by the current container.

length = 5	tag = 4
2 Byte	2 Byte
Idx 0..n	
1 Bytes	
16	32

RECORDING_LOAD_PERC

Current load of a local recording media in percent

length = 5	tag = 8
2 Byte	2 Byte
Current load 0..100 percent	
1 Bytes	
16	32

RECORDING_MEDIA_STATUS

Current status of a local recording media

length = 8	tag = 9
2 Byte	2 Byte
Status code	
4 Bytes	
16	32

RECORDING_MEDIA_STATUS Status codes

<u>Values:</u>	
No device plugged	1
Device detected and can be used	2
Hardware init failed	3
Hardware driver IO error	4
Hardware CRC error	5
Hardware IO timeout	6
Warning, Media has sometimes slow IO	7
Warning, Media is read-only (Either write-protected or end of life)	8
Media not suitable	9
Media too small	10

CONF_CPU_COUNT

Tag code	NumDes	Message	SNMP Support
0x0a09	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	number of cpus
Write	t_dword	access_right_service	not supported

CONF_SANITY_CHECK

Tag code	NumDes	Message	SNMP Support
0x09da	no	yes	yes
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read the array of sanity bits (bit0: hdd, bit1: device error host, bit2: device error coproc)
Write	p_octet	access_right_service	set the array of sanity bits (bit0:hdd)

CONF_ONVIF_STREAM_URI_EX

Tag code	NumDes	Message	SNMP Support
0x0be4	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	gets a extension to the onvif stream uri that will be appended in the GetStreamUri command
Write	p_string	access_right_service	sets a extension to the onvif stream uri that will be appended in the GetStreamUri command

CONF_NIGHT_MODE_STATE

Tag code		NumDes	Message	SNMP Support
0x0aa2		-	yes	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	0=night mode off; 1=night mode on (only for devices supporting night mode)	
Write	void	access_right_service	not supported	

CONF_BLOCK_BASED_STORAGE

Tag code	NumDes	Message	SNMP Support
0x0adf	no	no	no
Read	Datatype	Access Level	Description
	p_octet	access_right_internal	not supported
Write	p_octet	access_right_internal	read or write 512 byte memory blocks of flash (service for 3rd party modules like image-pipe dll or fpga)

Payload Structure

16	32
Domain 4 Bytes	
Operation 4 Bytes	
PageIndex 4 Bytes	
PageCount 4 Bytes	
Padding 16 Bytes ...	
Payload n x 512 Bytes ...	
8	24

Domain

Identifies the memory area to be accessed. Each module may have its own areas. The areas and their size have to be predefined by the firmware. Some may be permanent and some may get erased by the factory reset button.

Operation

Type of operation to be performed

Values:

BBSS_OP_READ	0
BBSS_OP_WRITE	1

PageIndex

Index of the first 512 byte page to be accessed

Values:

Index	0..n-1
-------	--------

PageCount

Number of 512 byte pages to be accessed

Padding

Padding up to a total hdr size of 32 bytes

Values:

Should be zero	0
----------------	---

Payload

n * 512 bytes payload to be read or written

Description

Read or write n blocks of 512 bytes to flash. All single blocks can be simply overwritten. A explicit erase is not required. Write is atomic on block basis which means that also in case of power-loss-while-write either the consistent old version or the new version of a single block is read back next time after reboot therefore doublebuffering is not required.

CONF_POE_GRANTED_POWER

Tag code		NumDes	Message	SNMP Support
0x0ae6		no	no	yes
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	read the current poe power granted by switch / midspan in tenths of Watts	
Write	t_word	access_right_service	write/limit the max power budget to be used by the device in tenths of Watts	

CONF_INSTALLER_SEQUENCE

Tag code		NumDes	Message	SNMP Support
0x0b0f		cam	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	0: installer sequence is deactivated; 1: installer sequence is allowed	
Write	t_dword	access_right_service	0: deactivate installer sequence; 1: allow installer sequence	

CONF_UPLOAD_HISTORY

Tag code		NumDes	Message	SNMP Support
0x0b44		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read the history of uploads to this device	
Write	p_octet	access_right_internal	save the history of uploads to this device	

CONF_STATIC_SERVER_URL

Tag code		NumDes	Message	SNMP Support
0x0b63		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	url of a static server for firmware updates (e.g. http://downloadstore.boschsecurity.com/index.php)	
Write	p_string	access_right_service	url of a static server for firmware updates (e.g. http://downloadstore.boschsecurity.com/index.php)	

CONF_GB28181

Tag code	NumDes	Message	SNMP Support
0x0ba2	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	configure GB28181
Write	p_octet	access_right_service	configure GB28181

Payload Structure

16		32
Enable 1 Byte	H264 Stream Cfg 1 Byte	Reserved 2 Byte
Heart beat time out 4 Bytes		
Registration time out 4 Bytes		
Server port 2 Byte		Device Port 2 Byte
Server URL 64 Bytes ...		
...		
Server ID 21 Bytes ...		
...		
	Device ID 21 Bytes	
...		
	Alarm Device Id 21 Bytes	
...		
		Password 128 Bytes
...		
	Reserved 753 Bytes	
...		
8	24	

Enable

1: Enable GB28181 client 0: Disable

H264 Stream Cfg

if 1, use h264 elementary stream (including startcodes) directly packed into RTP packets (non-RFC conform, but needed for GB28181 test tool)

Reserved

Must be written as 0

Heart beat time out

Define heart beat time out in seconds max. one day min. 5 seconds

Registration time out

Define registration time out in seconds max. one day min. 5 seconds

Server port

currently 5060 or 5511 can be used (server and device port must be equivalent server port is also used for device port)

Device Port

currently 5060 or 5511 can be used (server and device port must be equivalent server port is also used for device port)

Server URL

URL of GB28181 server

CONF_PRIVACY_MODE

Tag code		NumDes	Message	SNMP Support
0x0c33		no	yes	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	Read the privacy mode status: Byte 0 = On(1) / Off(0), Byte 1 = Source of Privacy Mode (RCP cmd = 0, Tap = 1), Byte 2-3 = opt. Timeout in min	
Write	t_dword	access_right_user	Set the privacy mode status: Byte 0 = On(1) / Off(0), Byte 1 = reserved (set to '0'), Byte 2-3 = opt. Timeout in minutes (only applicable if Byte 0 is 'On'. Then, after the timeout, privacy mode is automatically switched 'off' again)	

CONF_RUN_QR_READER

Tag code		NumDes	Message	SNMP Support
0x0c3a		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	not supported	
Write	t_dword	access_right_service	Run the QR code reader for a certain time (in seconds). (notice: values 0 and 0xFFFFFFFF not allowed; reserved for future use)	

CONF_PTZ_AUTO_ROTATE_MODE

Tag code		NumDes	Message	SNMP Support
0x0c3f		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	residential indoor ptz auto-rotate (auto-track) mode. 0=off, 1=std function, 2=production test mode	
Write	t_octet	access_right_service	residential indoor ptz auto-rotate (auto-track) mode. 0=off, 1=std function, 2=production test mode	

CONF_POWER_MONITOR_VALUES

Tag code	NumDes	Message	SNMP Support
0x0c53	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns values from all monitored power rails, see detailed description
Write	p_octet	access_right_service	not supported

Payload Structure

16	32
Number of rails 4 Bytes	
Number of rails values n x 40 Bytes	
...	
8	24

Number Of Rails

Number of monitored rails. Also indicates the number of rail values structure. Payload of complete command is 4 + (Number Of Rails)*40 Bytes

Number of rails values

structure for single rail values see below

Rail Values Structure

16	32
Options 4 Bytes	
Actual Voltage 4 Bytes	
Min Voltage 4 Bytes	
Max Voltage 4 Bytes	
Actual Current 4 Bytes	
Min Current 4 Bytes	
Max Current 4 Bytes	
Actual Power 4 Bytes	
Min Power 4 Bytes	
Max Power 4 Bytes	
8	24

Options

Values:

This is an or'ed bitfield of values listed below

current measurement valid	0x01
voltage measurement valid	0x02
power measurement valid	0x04

Actual Voltage

actual measured voltage, which is measured last, in uV

Min Voltage

minimum measured voltage in uV

Max Voltage

maximum measured voltage in uV

Actual Current

actual measured current, which is measured last in uA

Min Current

minimum measured current in uA

Max Current

maximum measured current in uA

Actual Power

actual measured power, which is measured last in uW

Min Power

minimum measured power in uW

Max Power

maximum measured power in uW

CONF_POWER_MONITOR_NAMES

Tag code	NumDes	Message	SNMP Support
0x0c54	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns names from all monitored power rails, see detailed description
Write	p_octet	access_right_service	not supported

Payload Structure

16	32
Number of rails 4 Bytes	
Names of all rails Number of rails names	
...	
8	24

Number Of Rails

Number of monitored rails.

Names of all rails

All names back to back, separated by zero

CONF_AUXILIARY_POWER

Tag code		NumDes	Message	SNMP Support
0x0c55		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns status and availability of auxiliary power, see detailed description	
Write	t_dword	access_right_service	enables or disables auxiliary power, see detailed description	

Payload Structure

has_pwr

indicates if the unit has auxiliary power (read only, write will be ignored)

Values:

has no auxilliray power	0
has auxilliray power	1

ena_pwr

indicates if auxiliary power is switched on

Values:

auxilliray power off	0
auxilliray power on	1

has_ovl

indicates if the unit has overload detection (read only, write will be ignored)

Values:

has no overload detection	0
has overload detection	1

ovl

indictaes if auxiliary power is overloaded (read only, write will be ignored)

Values:

auxiliary power is not overloaded	0
auxiliary power is overloaded	1

ovl_cnt

counts up if an overload occurs

Values:

no overload	0
nr of overload events	1 - 254
more than 254 overload events	255

reserved

read is undefined, should be zero when written

CONF_BLUETOOTH_CTRL

Tag code		NumDes	Message	SNMP Support
0x0c5c		Message : no	Description : returns Scan information of Bluetooth devices ##desc:./doc/CONF_BLUETOOTH_SCAN.htm##	no
Datatype		Access Level		Description
Read	%	access_right_minimal	%	
Write	%	access_right_service	%	

CONF_BLUETOOTH_SCAN

Tag	code	NumDes	Message	SNMP Support
	0x0c5d	no	no	no
	Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns Scan information of Bluetooth devices	
Write	%	access_right_service	%	

Payload Structure

			16	32
Scan Status	n Entries	reserved		
8 Bits	1 Byte	2 Bytes		

Sequence of n Entries:

Len 2 Bytes		Status 16 Bits	
MAC 4 Bytes			
MAC (cont.) 2 Bytes		RSSI 2 Bytes	
Name m Bytes			
		16	
		32	

Scan Status

				4	8
On/Off	Discover	Truncate	reserved		
1 Bit	1 Bit	1 Bit	5 Bits		

On/Off

Bluetooth switched on

Values:

Off	0
Off	1

Discover

1: Discovery is running, there will be no entries during discovery, retry later

Truncate

1: List is incomplete, not all devices listed

Entries

Number of Entries (n)

Len

Total Len of Entry

Status

reserved

MAC

Mac address of BT device

RSSI

value t.b.d

Name

Name of BT device, terminated with zero

CONF_LLDP_REQUESTED_POWER_TOTAL

Tag code		NumDes	Message	SNMP Support
0x0c8e		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	read the poe power requested by device in total (adder+device itself) in tenths of Watts	
Write	%	access_right_service	%	

CONF_LLDP_REQUESTED_POWER_CAM

Tag code		NumDes	Message	SNMP Support
0x0c8f		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	read the poe power requested by device (for the device alone) in tenths of Watts	
Write	%	access_right_service	%	

CONF_LLDP_ALLOCATED_POWER_TOTAL

Tag code	NumDes	Message	SNMP Support
0x0c90	no	no	no
Datatype	Access Level	Description	
Read	t_word	access_right_minimal	read the poe power allocated for the device in total (adder+device itself) in tenths of Watts
Write	%	access_right_service	%

CONF_LLDP_POWER_ADDER

Tag code	NumDes	Message	SNMP Support
0x0c92	no	no	no
Datatype	Access Level	Description	
Read	t_word	access_right_minimal	get the power volume that the camera should request via LLDP in addition to its own requirements; value is in tenths of watts; e.g. 9.9 watts results in a value of 99;
Write	t_word	access_right_service	set the power volume that the camera should request via LLDP in addition to its own requirements; value is in tenths of watts; e.g. 9.9 watts results in a value of 99; when the adder value is different from 0, the device identifies as type 2 PD of class 4; when adder value is 0 and the device specific requirement is below 13 W, the device signals type 1 PD of the respective class; currently, the total power requested by a camera can not exceed the 25.5W specified as maximum in IEEE802.3at-2009

CONF_BASE_POE_CLASS

Tag code		NumDes	Message	SNMP Support
0x0ca0		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_service	read the base poe class of the device (w/o considering power adder); 1: class0, 2: class1, 3: class2, etc. 255: no PoE	
Write	%	access_right_service	%	

CONF_SIGNALLED_POE_CLASS

Tag code		NumDes	Message	SNMP Support
0x0ca1		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_service	read the signalled poe class of the device (incl. power adder); 1: class0, 2: class1, 3: class2, etc. 255: no PoE	
Write	%	access_right_service	%	

CONF_STRATOCAST_ONOFF

Tag code		NumDes	Message	SNMP Support
0x0cab		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	Switch on or off the automatic start of stratocast service	
Write	f_flag	access_right_service	Switch on (true) or off (false) the automatic start of stratocast service	

CONF_STRATOCAST_REGISTER

Tag code		NumDes	Message	SNMP Support
0x0cad		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	not supported	
Write	p_string	access_right_service	Register at stratocast service and switch on automatic reconnect. As payload the activation code must be provided	

CONF_STRATOCAST_STATE

Tag code	NumDes	Message	SNMP Support
0x0cb4	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	Get the actual state of the stratocast connection (0=inactive, 1=connecting, 2=registering, 3=connected)
Write	t_dword	access_right_service	not supported

CONF_NBR_OF_IMU

Tag code	NumDes	Message	SNMP Support
0x0cd5	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of available IMU sensors (IMU: Inertial Measurement Unit; accelerometer, gyroscope, ..)
Write	t_dword	access_right_service	not supported

CONF_MPEG_AUDIO_SAMPLING_FREQ

Tag code	NumDes	Message	SNMP Support
0x0932	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	mpeg audio sampling frequency (Hz)
Write	t_dword	access_right_service	not supported

CONF_MPEG4_CURRENT_PARAMS

Tag code		NumDes	Message	SNMP Support
0x0600		coder instance (1 to n, 0 for session based)	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the current profile preset number for the specified encoder (NumDesc)	
Write	t_dword	access_right_service	sets the video encoder (given by NumDesc) to a preset (payload). If recording is running and the iframe distance is 0, the iframe distance of the preset will be patched to a recording suitable value. For transcoder: if the request contains the replay session id and no num descriptor, the device will assign the preset to the transcoder of the replay session. If the preset is empty the transcoder will be disabled. For exclusive (dual) stream instances: if the request contains the session id and the num descriptor is 0, the previously configured preset with its session based (non-permanent) modifications will be applied to the encoder.	

CONF_MPEG4_CURRENT_PARAMS_TRANSCODER

Tag code		NumDes	Message	SNMP Support
0x0b4e		has to be zero	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	sessionID references the replay session; 0:= no transcoding; 1-8: video preset of the transcoder	
Write	t_dword	access_right_user	assign preset n (1,..N) to transcoder session; preset 0 means no transcoding	

CONF_MPEG4_CURRENT_PARAMS_REL_CODER

Tag code	NumDes	Message	SNMP Support
0x061c	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get the current profile preset number for the specified encoder (relative to line).
Write	p_octet	access_right_service	sets the video encoder (relative to line) to a preset.

Payload Structure

		16	32
Line	Coder	Coding Capabilities	
1 Byte	1 Byte	2 Bytes	
Preset	Reserved	Reserved	Reserved
1 Byte	1 Byte	1 Byte	1 Byte
8		24	

Line

Video input line

Coder

Relative coder number (relative to line)

Coding Capabilities

Coding capabilities of encoder.
All coding capabilities are one or multiple of:

Values:

H.263	0x0002
Mpeg 4	0x0004
Mpeg 2	0x0008
H.264	0x0040

Preset

Number of the encoder preset profile

Notes:

When reading the preset profile, the according byte in the payload will be set.

CONF_MPEG4_NAME

Tag code		NumDes	Message	SNMP Support
0x0602		profile preset	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	get the name of the preset given by the Numeric Descriptor	
Write	p_string	access_right_service	sets the name of the preset number given by the Numeric Descriptor	

CONF_MPEG4_BANDWIDTH_KBPS

Tag code		NumDes	Message	SNMP Support
0x0607		profile preset	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	reads the bandwidth of selected preset	
Write	t_dword	access_right_service	sets the bandwidth of selected preset, sessionID to address session based video params	

CONF_MPEG4_BANDWIDTH_KBPS_SOFT_LIMIT

Tag code		NumDes	Message	SNMP Support
0x0612		profile preset	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	reads the bandwidth soft limit (in KBPS) of selected preset	
Write	t_dword	access_right_service	sets the bandwith soft limit (in KBPS) of selected preset, sessionID to address session based video params	

CONF_MPEG4_BANDWIDTH_KBPS_HARD_LIMIT

	Tag code	NumDes	Message	SNMP Support
	0x0613	profile preset	no	no
	Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	obsolete	
Write	t_dword	access_right_service	obsolete	

CONF_MPEG4_INTRA_FRAME_DISTANCE

	Tag code	NumDes	Message	SNMP Support
	0x0604	profile preset	no	no
	Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	gets the intra frame distance of selected preset	
Write	t_dword	access_right_service	sets the intra frame distance of selected preset (not supported while recording is running or configured to active and the preset is used on the recording schedule), sessionID to address session based video params	

CONF_MPEG4_FRAME_SKIP_RATIO

	Tag code	NumDes	Message	SNMP Support
	0x0606	profile preset	no	no
	Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	gets Mpeg4 frame skip ratio (1=all frames ,...)	
Write	t_dword	access_right_service	set Mpeg4 frame skip ratio (1=all frames ,...), sessionID to address session based video params	

CONF_MPEG4_RESOLUTION

Tag code	NumDes	Message	SNMP Support
0x0608	profile preset, 0 if sessionID is used	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	gets the spatial resolution for selected preset. Possible resolutions depending on the device platform (CPPx). They can be queried with the command CONF_ENC_PROFILE_RESOLUTION_OPTIONS. Info: for devices where CONF_ENC_BASE_OPERATION_MODE_TYPE is '1' this command only applies for SD resolutions (0=QCIF, 1=CIF, 2=2CIF, 3=4CIF, 4=(1/2 D1), 5=(2/3D1), 6=QVGA, 7=VGA, 8=WD144 (256x144), 9=WD288 (512x288), 10=WD432 (768x432), 18=WD1 (960H)). HD resolutions then need to be set via CONF_VIDEO_H264_ENC_BASE_OPERATION_MODE. For devices where CONF_ENC_BASE_OPERATION_MODE_TYPE is '0' (no base operation modes) then this command also applies for HD resolutions. The t_dword payload is then as follows: upper 2 Bytes of DWORD = width, lower 2 Bytes = height. (e.g. 1280x720 -> t_dword = 0x050002D0 = 83886800dec); HD resolutions on transcoder: 720 (up to 720x1280), 1080 (up to 1080x1920), 2160(up to 2160x3840); SessionID to address session based video params
Write	t_dword	access_right_service	sets the spatial resolution for selected preset. Possible resolutions depending on the device platform (CPPx). They can be queried with the command CONF_ENC_PROFILE_RESOLUTION_OPTIONS. Info: for devices where CONF_ENC_BASE_OPERATION_MODE_TYPE is '1' this command only applies for SD resolutions (0=QCIF, 1=CIF, 2=2CIF, 3=4CIF, 4=(1/2 D1), 5=(2/3D1), 6=QVGA, 7=VGA, 8=WD144 (256x144), 9=WD288 (512x288), 10=WD432 (768x432), 18=WD1 (960H)). HD resolutions then need to be set via CONF_VIDEO_H264_ENC_BASE_OPERATION_MODE. For devices where CONF_ENC_BASE_OPERATION_MODE_TYPE is '0' (no base operation modes) then this command also applies for HD resolutions. The t_dword payload is then as follows: upper 2 Bytes of DWORD = width, lower 2 Bytes = height. (e.g. 1280x720 -> t_dword = 0x050002D0 = 83886800dec); HD resolutions on transcoder: 720 (up to 720x1280), 1080 (up to 1080x1920), 2160(up to 2160x3840); SessionID to address session based video params

CONF_MPEG4_FIELD_MODE

Tag code	NumDes	Message	SNMP Support
0x060e	yes	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	get Mpeg4 field mode (0=progressive, 1=merged, 2=separated)
Write	t_octet	access_right_service	set Mpeg4 field mode (0=progressive, 1=merged field, 2=separated field)

CONF_MPEG4_DEFAULTS

Tag code	NumDes	Message	SNMP Support
0x0601	profile preset	no	no
Datatype	Access Level	Description	
Read	void	access_right_minimal	not supported
Write	flag	access_right_service	set the selected preset params to the default values (if the recording is running and the preset in on the recording schedule, the preset will keep its old iframe distance)

CONF_MPEG4_I_FRAME_QUANT

Tag code		NumDes	Message	SNMP Support
0x060a		yes	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets the I frame quantizer (1-31,0=auto) for selected preset	
Write	t_dword	access_right_service	sets the I frame quantizer (1-31,0=auto) of selected preset	

CONF_MPEG4_P_FRAME_QUANT

Tag code		NumDes	Message	SNMP Support
0x060b		profile preset	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets the P frame quantizer (1-31,0=auto) for selected preset	
Write	t_dword	access_right_service	sets the P frame quantizer (1-31,0=auto) for selected preset	

CONF_MPEG4_PARAMS_MAX_NUM

Tag code	NumDes	Message	SNMP Support
0x0614	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	Number of MPEG4 presets
Write	%	access_right_service	%

CONF_MPEG4_AVC_I_FRAME_QUANT

Tag code	NumDes	Message	SNMP Support
0x0615	profile preset	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	gets the I frame quantizer (9-51,0=auto) for selected preset
Write	t_dword	access_right_service	sets the I frame quantizer (0=auto,9-51) for selected preset

CONF_MPEG4_AVC_P_FRAME_QUANT

Tag code	NumDes	Message	SNMP Support
0x0616	profile preset	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	gets the P frame max quantizer (9-51,0=auto) for selected preset
Write	t_dword	access_right_service	sets the P frame max quantizer (0=auto,9...51) for selected preset

CONF_MPEG4_AVC_P_FRAME_QUANT_MIN

Tag code		NumDes	Message	SNMP Support
0x0620		profile preset	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets the P frame min quantizer (9-51,0=auto) for selected preset	
Write	t_dword	access_right_service	sets the P frame min quantizer (0=auto,9...51) for selected preset, sessionID to address session based video params	

CONF_MPEG4_AVC_DELTA_IPQUANT

Tag code		NumDes	Message	SNMP Support
0x0621		profile preset	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	gets the difference (-10..+10) between I and P-Frame quantization for selected preset	
Write	t_int	access_right_service	sets the difference (-10..+10) between I- and P-Frame quantization for selected preset	

CONF_MPEG4_AVC_QUANT_ADJ_REGION_1

Tag code		NumDes	Message	SNMP Support
0x0624		profile preset	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	gets the quality difference (H.264 QP Units; -51...+51) between normal and background regions; use CONF_ROI_OPTIONS to query options if only positiv offsets are allowed offsets between 0...+51 can be read	
Write	t_int	access_right_service	sets the quality difference (H.264 QP units; -51...+51) between normal and background regions; use CONF_ROI_OPTIONS to query options if only positiv offsets are allowed offsets between 0...+51 can be set	

CONF_MPEG4_AVC_QUANT_ADJ_REGION_2

Tag code		NumDes	Message	SNMP Support
0x0625		profile preset	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	gets the quality difference (H.264 QP Units; -51...+51) between normal and object regions; use CONF_ROI_OPTIONS to query options if only positiv offsets are allowed offsets between 0...+51 can be read	
Write	t_int	access_right_service	sets the quality difference (H.264 QP units; -51...+51) between normal and object regions; use CONF_ROI_OPTIONS to query options if only positiv offsets are allowed offsets between 0...+51 can be set	

CONF_MPEG4_AVC_DEBLOCKING_ENABLE

Tag code		NumDes	Message	SNMP Support
0x0617		profile preset	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	gets the deblocking filter status for selected preset	
Write	flag	access_right_service	enables/disables the H264 deblocking filter	

CONF_MPEG4_AVC_DEBLOCKING_ALPHA

Tag code		NumDes	Message	SNMP Support
0x0618		profile preset	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	gets the alpha coefficient of the H264 deblocking filter for the selected preset	
Write	t_int	access_right_service	set the alpha H264 deblocking coefficient (-5...5)	

CONF_MPEG4_AVC_DEBLOCKING_BETA

Tag code	NumDes	Message	SNMP Support
0x0619	profile preset	no	no
Datatype	Access Level	Description	
Read	t_int	access_right_minimal	gets the beta coefficient of the H264 deblocking filter for the selected preset
Write	t_int	access_right_service	set the beta H264 deblocking coefficient (-5...5)

CONF_MPEG4_AVC_CHROMA_QUANT_OFF

Tag code	NumDes	Message	SNMP Support
0x061a	profile preset	no	no
Datatype	Access Level	Description	
Read	t_int	access_right_minimal	gets the chroma quantisation offset for the selected preset
Write	t_int	access_right_service	set the chroma quantisation offset (-12...12)

CONF_MPEG4_AVC_CODING_MODE

Tag code	NumDes	Message	SNMP Support
0x0a45	profile preset	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	gets the coding mode of the selected preset (0=frame; 1=field; 2=makro block adaptive ff; 3=picture adaptive ff)
Write	t_octet	access_right_service	sets the coding mode for the selected preset (0=frame; 1=field; 2=makro block adaptive ff; 3=picture adaptive ff)

CONF_MPEG4_AVC_GOP_STRUCTURE

Tag code		NumDes	Message	SNMP Support
0x0a94		profile preset	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	gets the GOP structure of the selected preset (0=IP; 1=IBP; 2=IBBP; 3=IBBRBP)	
Write	t_octet	access_right_service	sets the GOP structure for the selected preset (0=IP; 1=IBP; 2=IBBP; 3=IBBRBP)	

CONF_GOP_STRUCTURE_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0bef		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get a list of options, which can be selected by CONF_MPEG4_AVC_GOP_STRUCTURE options are defined by MPEG4_AVC_GOP_STRUCTURE (Format: Byte 0 (len); Byte (1-len) supported options)	
Write	p_octet	access_right_service	not supported	

CONF_VIDEO_ENC_P_REF_LIST_SIZE

Tag code		NumDes	Message	SNMP Support
0x0627		profile preset	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	max. number of reference frames used by a P-slices in H.26x streams with 0 = unrestricted	
Write	t_octet	access_right_service	max. number of reference frames used by a P-slice in H.26x streams with 0 = unrestricted. Query largest support value via GET_P_REF_LIST_SIZE_LIMIT	

CONF_GET_VIDEO_ENC_P_REF_LIST_SIZE_LIMIT

Tag code		NumDes	Message	SNMP Support
0x0628			no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	get the largest value supported by VIDEO_ENC_P_REF_LIST_SIZE; 0 indicates that the value is not user-adjustible	
Write	t_octet	access_right_service	not supported	

CONF_MPEG4_AVC_CABAC

Tag code		NumDes	Message	SNMP Support
0x0aa6		profile preset	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	gets cabac for the selected preset (0=off; 1=on)	
Write	t_octet	access_right_service	sets cabac for the selected preset (0=off; 1=on)	

CONF_MPEG4_AVC_BITRATE_OPTIMIZATION_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0c49		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Byte[0] basicSupport; Byte[1] reserved; Byte[2-7] reserved	
Write	p_octet	access_right_service	not supported	

CONF_ENC_DYN_SCENE_CTRL

Tag code		NumDes	Message	SNMP Support
0x0cb6		line	no	no

16

32

Generic description

The command provides enhanced encoder bitrate statistics every record describes a table of bitrates.
The table has a time base in sec typically sec, min, hour, days and weeks is provided
The first entry of the list can also only be active since a part of the cell e.g. cell time base is one day
may this is only active since 300 sec. This time is signaled via lastCellIsActiveSinceSec

Definition of the global parameters, these parameters are vaild for all record entrys:
GlobalParameters.localTimeSecoundsSince2000 local camera time which corresponds to the delivered entrys
GlobalParameters.UTCSecondsSince2000 utc time which corresponds to the delivered entrys

Definition of the record entrys:
timeBaseInSec : base time for all cells 2-elementCount base time of cell 1 is signaled via lastCellIsActiveSinceSec
lastCellIsActiveSinceSec : entry [0] is active since lastCellIsActiveSinceSec
elementCount : nr elements
bitrate[1...elementCount]: example timeBaseInSec = 60, lastCellIsActiveSinceSec = 20 sec, elementCount = 256
bitrate[1] : average bitrate{0 s ,...- 20 s}
bitrate[2] : average bitrate{-20 s,...- 80 s}
bitrate[3] : average bitrate{-80 s,...- 140 s}
bitrate[...]
bitrate[elementCount]

CONF_VIDEO_ENCODER_ENCODED_BYTES

Tag code		NumDes	Message	SNMP Support
0x0af6		coder instance	no	yes
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	Get encoded bytes (32 Bit Counter) since bootup. Only supported for h.264 and Jpeg encoder.	
Write	t_dword	access_right_service	not supported	

CONF_ENC_CURRENT_RESOLUTION

Tag code		NumDes	Message	SNMP Support
0x0b4b		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get the current resolution (width + height) in pixel of an encoder (relative to line; starting with '1'). First two bytes of payload (line+coder) need to be specified as request payload. 1st Byte: video line (needs to be set when reading); 2nd Byte: encoder (needs to be set when reading); 3.+4. Byte: width; 5.+6. Byte: height; 7.+8. Byte reserved	
Write	p_octet	access_right_service	not supported	

CONF_ENC_PROFILE_BASIC_PARAMS

Tag code		NumDes	Message	SNMP Support
0x0b2e		profile preset	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get basic parameters of an encoder profile preset. 1st DWORD: Resolution (parameter values see CONF_MPEG4_RESOLUTION); 2nd DWORD: Skip Ratio (values see CONF_MPEG4_FRAME_SKIP_RATIO); 3rd DWORD: Target bit rate (values see CONF_MPEG4_BANDWIDTH_KBPS); 4th DWORD: Maximum bit rate (values see CONF_MPEG4_BANDWIDTH_KBPS_SOFT_LIMIT)	
Write	p_octet	access_right_service	set basic parameters of an encoder profile preset and apply them instantly. 1st DWORD: Resolution (parameter values see CONF_MPEG4_RESOLUTION); 2nd DWORD: Skip Ratio (values see CONF_MPEG4_FRAME_SKIP_RATIO); 3rd DWORD: Target bit rate (values see CONF_MPEG4_BANDWIDTH_KBPS); 4th DWORD: Maximum bit rate (values see CONF_MPEG4_BANDWIDTH_KBPS_SOFT_LIMIT)	

CONF_ENC_PROFILE_PARAMS

Tag code	NumDes	Message	SNMP Support
0x0cb9	profile preset	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get the parameters of an encoder profile preset. Reply is in tagged format, see detailed description
Write	p_octet	access_right_service	set one or more parameters of an encoder profile preset. Payload is in tagged format, see detailed description

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes - 4	
length 2 Byte	tag 2 Byte
payload length Bytes - 4	
16	32

Generic description

The format has a tagged structure.
Each tagged entry consists of a length field, a tag ID and a payload.
Allows to read/write all relevant parameters of an encoder profile preset like resolution, skip, bandwidth, etc... within one single command.
In read direction all available tags are returned.
In write direction just the parameters/tags which should be changed need to be sent. So either one tag, several tags or all available tags can be provided.

Tags

Each tag ID in this command represents the according RCP command which already exists to read/write one of the encoder profile parameters individually.
I.e. this command combines several individual RCP commands within one command and provides the parameters as separate tags.
The payload of the tag entries corresponds to the related RCP command. For detailed information please check the documentation of the according RCP command.

E.g. one of the supported tags is 0x0608 (CONF_MPEG4_RESOLUTION).

length = 8 2 Byte	tag = 0x0608 2 Byte		
resolution 4 Bytes			
8	16	24	32

The currently supported tag IDs are:

- 0x0602 - CONF_MPEG4_NAME
- 0x0604 - CONF_MPEG4_INTRA_FRAME_DISTANCE
- 0x0606 - CONF_MPEG4_FRAME_SKIP_RATIO
- 0x0607 - CONF_MPEG4_BANDWIDTH_KBPS
- 0x0608 - CONF_MPEG4_RESOLUTION
- 0x0612 - CONF_MPEG4_BANDWIDTH_KBPS_SOFT_LIMIT
- 0x0620 - CONF_MPEG4_AVC_P_FRAME_QUANT_MIN
- 0x0621 - CONF_MPEG4_AVC_DELTA_IPQUANT
- 0x0622 - CONF_VIDEO_BITRATE_AVERAGING_PERIOD
- 0x0624 - CONF_MPEG4_AVC_QUANT_ADJ_REGION_1
- 0x0625 - CONF_MPEG4_AVC_QUANT_ADJ_REGION_2
- 0x0627 - CONF_VIDEO_ENC_P_REF_LIST_SIZE
- 0x0a94 - CONF_MPEG4_AVC_GOP_STRUCTURE
- 0x0c37 - CONF_MPEG4_AVC_BITRATE_OPTIMIZATION

CONF_ROI

Tag code	NumDes	Message	SNMP Support
0x0b48	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_live	see detailed description

Select region of interest. The Session-ID identifies the video coder.

Payload Structure

16		32	
hPos	2 Bytes	vPos	2 Bytes
size	2 Bytes	reserved	2 Bytes

hPos / vPos

Center position of the cropping window in relative coordinates (0..32768). E.g. (0, 0) is upper left; (16384, 16384) is the center of the original image.

size

Size of the cropping window in relative coordinates (0..32768). The aspect ratio will be preserved.

CONF_ROI_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0c7e		cam	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get ROI Encoding options per Line Byte 0, [0x1 support ROI in h.264, 0x2 support ROI in h.265], Byte 1 support CONF_ROI_PRESET_POS_INTERNAL, Byte 2, [0 = default, 0x1 only allow positiv qp offsets at encoder regions are allowed; reduction o 3-7 reserved	
Write	p_octet	access_right_live	not supported	

CONF_VIDEO_ENC_TEMP_QUANT_ADJ

Tag code	NumDes	Message	SNMP Support
0x0626	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get temporary encoding quality adjustment see
Write	p_octet	access_right_live	temporary encoding quality adjustmens see

Payload Structure

enable

Values:

enable temporary quality adjustments	1
disable temporary quality adjustments	0

deltaQp

Intended quality adjustment in H.264 QP units. If enable is 0, this field must also be set to 0. Otherwise the allowed range is -51..51 with negative values indicating higher quality and positive ones lower quality

reserved

set to 0

left

relative position of the left edge of the adjustment region within the complete encoded image

right

relative position of the right edge of the adjustment region within the complete encoded image

top

relative position of the upper edge of the adjustment region within the complete encoded image

bottom

relative position of the lower edge of the adjustment region within the complete encoded image

Description

The encoder, to which the quality adjustment is to be applied is identified via the RCP session.

The area, in which the qualitiy is adjusted is characterized by the position of the edges of a rectangle within a virtual coordinate system with a nominal range of [0..+32768]x[0..32768] for the complete encoded picture (0=top/left edge, 32768=bottom/right edge). The actually adjusted area will be enlarged as needed by the encoder.

Note, that the payload may contaion only first octet, if enable is set to 0

CONF_DPTZ_DYNAMIC_CAPS

Tag code		NumDes	Message	SNMP Support
0x0bb7		0 - addressing via Session ID	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	read current/dynamic DPTZ capabilities. 1st bit: ROI, 2nd bit: E-PTZ-Tracker	
Write	t_dword	access_right_service	not supported	

CONF_DPTZ_STATIC_CAPS

Tag code	NumDes	Message	SNMP Support
0x0bfd	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	%	access_right_service	%

Payload Structure

Generic description

Read current DPTZ capabilities. They may are changed if CONF_VIDEO_H264_ENC_BASE_OPERATION_MODE or CONF_VIDEO_LINE_DEWARPING_MODE is changed.
The command consists of n entries with a fixed length of 8 Bytes and the following data.

Tags

Record:

Line 1 Byte	Stream 1 Byte	Bicom PTZ Steering 1 Byte	Auto Tracker Type 1 Byte

4	Info Stamping Region	yes	yes Position Type {0,3}	NO	yes	yes	yes
5	Spinner Region	yes	yes Position Type {0,3}	NO	yes	yes	yes
6	System Controller Region 1	yes	yes Position Type {0,3}	internal	yes	yes	yes
7	System Controller Region 2	yes	yes Position Type {0,3}	internal	yes	yes	yes
8	System Controller Region 3	yes	yes Position Type {0,3}	internal	yes	yes	yes
9	Seperate Logo Area	yes	yes Position Type {0,3}	NO	yes	yes	no

CONF_STAMP_ATTR_ALARM* for custom position config CONF_ALARM_DISP_VAL needs to be set to 3

Region Payload Length

Number of bytes of all enclosed tags inside this region.

Tag ID

1	Visibility
2	Position
3	Text
4	Font size (only allowed in region 0)
5	Transparent Background
6	Color

Tag Payload Length

Payload length in bytes of the tag denoted in "Tag ID".

Tag Payload Length

Payload of the tag. See below for details of the respective tag.

Tag 1: Visibility

Tag ID = 1 2 Bytes	Tag Payload Length = 1 2 Bytes
Visibility 1 Byte	

Visibility

0	Hidden
---	--------

Tag 2: Position

Tag ID = 2 2 Bytes		Tag Payload Length = 3 2 Bytes	
Position Type 1 Byte	Position X 1 Byte	Position Y 1 Byte	

Position Type

0 = OFF; 3 = Custom; in some commands also 1 = bottom, 2 = top is supported is this case Position X anx Y is ignored. See above table.

Position X

Position X is an integer value from 0 to 255, where 0 is the left border of the image and 255 is the right border of the image.

Position Y

Position Y is an integer value from 0 to 255, where 0 is the top border of the image and 255 is the bottom border of the image.

Tag 4: Font size

Tag ID = 4 2 Bytes		Tag Payload Length = 1 2 Bytes
Font size 1 Byte		

Font size

- 0Normal
- 1Big

Tag 5: Transparent Background

Tag ID = 5 2 Bytes		Tag Payload Length = 1 2 Bytes
Transparent background 1 Byte		

Transparent background

- 0No transparent background
- 1Transparent background

Tag 6: Color

Tag ID = 6 2 Bytes		Tag Payload Length = 12 2 Bytes	
Color Mode 1 Byte	Reserved 3 Bytes		
Background - Red 1 Byte	Background - Green 1 Byte	Background - Blue 1 Byte	Reserved 1 Byte
Text - Red 1 Byte	Text - Green 1 Byte	Text - Blue 1 Byte	Reserved 1 Byte

Color Mode

0: RGB values are used

Background - Red/Green/Blue

Components of background color. Integer values from 0 to 255.

Text - Red/Green/Blue

Components of text color. Integer values from 0 to 255.

CONF_ENC_STAMPING_PROPERTIES

	Tag code	NumDes	Message	SNMP Support

seperateLogoAreaSupport 1 Byte	infoStampSupport 1 Byte	maxLogoSize 1 Byte	reserved 1 Byte
colorSupport 1 Byte	reserved 3 Bytes		

UTF16CharsPerLine

UTF16 chars per line

CamNameLines

Number of stamping lines available at CONF_CAMNAME_LINES

AlarmStampingLines

Number of alarm stamping lines

TimeStampSupport

1: time stamping support

TimeStampRes

Time stamp resolution, 1 also ms stamping is supported

TranspStampSupport

1: transparent stamping is supported

bannerModeSupport

1 : name stamping supports banner mode 0xFF : all stamping areas supports banner mode

extendedSysconAreas

Number of extended syscon areas. In CPP7.3 this is usually 3, in earlier platforms 0.

SpinnerStampSupport

1: spinner stamping support

BigFontSupport

1: big font support

seperateLogoAreaSupport

1: seperate logo area is supported

maxLogoSize

maximum logo size

1: 128x128 pixels

2: 300x300 pixels

colorSupport

1: stamping color can be changed

Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	see detailed description

Supported for CPP4, CPP6, CPP7 and CPP7.3. For other platforms use CONF_STAMP instead.

Payload Structure

x 1 Byte	y 1 Byte	reserved 2 Bytes
attributes 4 Bytes		
reserved 2 Bytes		flags 2 Bytes

x

X-Position (0...255) where the string should be displayed (0 is left)

y

Y-Position (0...255) where the string should be displayed (0 is up)

attributes (use CONF_ENC_STAMPING_PROPERTIES to determine supported options)

Values:

Bit 20	Draw a box around the text or transparent text background (0=box, 1=transparent)
Bit 21	Draw a banner from top to end of name text if y pos =< 128 from bottom if ypos > 128)

flags

Values:

Bit 0	Reserved
Bit 1	Enable logo stamping (0=off, 1=on)
Bit 2	Logo position relative to font (0=left, 1=right)
Bit 3	Display only logo (0=off, 1=on)

reserved

Reserved fields must be written as 0

CONF_STAMP_ATTR_TIME

CONF_STAMP_WIDTH

Tag code	NumDes	Message	SNMP Support
0x0a93	video line (1,...)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read the width of the current stamping in pixels. See detailed description
Write	void	access_right_service	not supported

Payload Structure

Note: This command can only be read. The payload defines the stamping which should be read and returns the width in the corresponding field.

Stamping Type

Defines the stamping type of which the width should be determined.
The type can be one of the following:

Values:

Time Stamp	0x0001
Name Stamp row 1	0x0002
Name Stamp row 2	0x0003
Alarm Stamp	0x0004
Info Stamp	0x0005

Width

Width of the stamping in pixels (hex)

CONF_VIDEO_CURRENT_PARAMS_CODNBR

Tag code	NumDes	Message	SNMP Support
0x0982	coder instance (1 to n, 0 for session based)	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get the current profile preset number for the specified encoder (NumDesc) sets the video encoder (given by NumDesc) to a preset (payload). If recording is running and the iframe distance is 0, the iframe distance of the preset will be patched to a recording suitable value. For transcoder: if the request contains the replay session id and no num descriptor, the device will assign the preset to the transcoder of the replay session. If the preset is empty the transcoder will be disabled. For exclusive (dual) stream instances: if the request contains the session id and the num descriptor is 0, the previously configured preset with its session based (non-permanent) modifications will be applied to the encoder.
Write	t_dword	access_right_service	

CONF_MAX_NBR_OF_ENC_STREAMS

Tag code	NumDes	Message	SNMP Support
0x029e	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	Number of encoder streams
Write	t_dword	access_right_service	read only

CONF_WATERMARK

Tag code	NumDes	Message	SNMP Support
0x0924	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	0=watermark is disabled; 1=classic watermark is enabled, 2=video authentication(low profile), 3=video authentication(mid profile), 4=video authentication(high profile)
Write	t_octet	access_right_service	0=disables watermark; 1=classic watermark, 2=video authentication(low profile), 3=video authentication(mid profile), 4=video authentication(high profile)

CONF_CODER_VIDEO_OPERATION_MODE

Tag code	NumDes	Message	SNMP Support
0x0a9c	absolute coder instance, if zero - read out, if supported global mode	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	see detailed description
Write	t_dword	access_right_service	see detailed description

Global device configuration mode

There are two different modes signaled via
INDIVIDUAL_ENCODER_OPERATION_MODE_CONFIG @CONF_DEVICE_CAPABILITIES
1: **invidual encoder configuration mode**:
CONF_CODER_VIDEO_OPERATION_MODE, num parameter for a specific absolute coder has to be provided; global configuration (numDesc = 0) is not supported
0: **global encoder configuration mode** :
CONF_CODER_VIDEO_OPERATION_MODE, num parameter supports only 0 as global option for all possible encoders

line dependent or global capabilityts

1: if **invidual encoder configuration mode** is supported
use CONF_CODER_VIDEO_OPERATION_MODE_OPTIONS with NumDesc = absolute coder number to get the supported options at CONF_CODER_VIDEO_OPERATION_MODE
0: if **global encoder configuration mode** is supported
use CONF_CODER_VIDEO_OPERATION_MODE_OPTIONS with NumDesc = 0 to get the supported global options at CONF_CODER_VIDEO_OPERATION_MODE

CONF_CODER_VIDEO_OPERATION_MODE

Set one video coder (absolute coder number given by NumDesc) or all video coders, which can handle the option, depending on the supported **configuration mode**, to a video operation mode.

Allowed options can be queried by CONF_CODER_VIDEO_OPERATION_MODE_OPTIONS: 0 = jpeg, 1 = h263, 2 = h264, 3 = h265, 0x103 = h_265 without B-Frames.
Live connections will be dropped; Only applicable if recording isn't active and configured to off.

CONF_CODER_VIDEO_OPERATION_OPTION

Tag code	NumDes	Message	SNMP Support
0x0aa4	coder instance	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	obsolete: use VIDEO_H264_ENC_BASE_OPERATION_MODE instead
Write	t_dword	access_right_service	obsolete: use VIDEO_H264_ENC_BASE_OPERATION_MODE instead

CONF_CODER_VIDEO_OPERATION_MODE_OPTIONS

Tag code	NumDes	Message	SNMP Support
0x0ca3	absolute coder instance, if 0 global options are provided	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	list of options (DWORDS) which can be written at CONF_CODER_VIDEO_OPERATION_MODE for a specific coder
Write	p_octet	access_right_service	not supported

CONF_VIDEO_H264_ENC_CONFIG

Tag code	NumDes	Message	SNMP Support
0x0ad2	Message : no	Description : get the profile for each h.264 encoder per line for each time. DWORD 1: Mode, 0=live mode, 1-10: schedule number; DWORD 2: profile for first stream, DWORD 3: profile for second stream...	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	p_octet	access_right_service	set the profile for each h.264 encoder per line for each time. DWORD 1: Mode, 0=live mode, 1-10: schedule number; DWORD 2: profile for first stream, DWORD 3: profile for second stream... (if recording on that cam isn't running, the setting for live mode(0) will take place immediately); Notice: the number of expected streams can be queried with CONF_NBR_OF_ENC_STREAMS

CONF_VIDEO_H264_ENC_CONFIG_DEFAULTS

Tag code	NumDes	Message	SNMP Support
0x0b4d	cam	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read not supported
Write	t_dword	access_right_service	set the default profile for each h.264 encoder per line for each time. Payload: Mode, 0=live mode, 1-10: recording schedule number. (if recording on that cam isn't running, the setting for live mode(0) will take place imidiatly)

CONF_VIDEO_H264_ENC_CONFIG_BULK

Tag code	NumDes	Message	SNMP Support
0x0ad9	Message : no	Description : get the profiles for each h.264 encoder per line for each time; this request will supply all Modes 0-10 in one reply; returns: DWORD 1: NbrOfStreamsPerMode, remaining payload 11x payload of VIDEO_H264_ENC_CONFIG	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	p_octet	access_right_service	set the profiles for each h.264 encoder per line for each time; this request must supply all Modes 0-10 in one request; DWORD 1: NbrOfStreamsPerMode, remaining payload 11x payload of VIDEO_H264_ENC_CONFIG; Notice: the expected 'NbrOfStreamsPerMode' can be queried with CONF_NBR_OF_ENC_STREAMS

Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_service	not supported

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes -4	
16	32

Generic description

The command allows to query the lens transfer function of the camera.
This command is not supported for all cameras. In the case of CONF_DEVICE_CAPABILITIES -> PTZ_ON_CLIENT_TAG = TRUE
A lens curve must be present.

Coordinate System [Picture]h
(x = 0,y = 0) ----- (x = 0, y = 32768)
...
... (x = 16384, y = 16384)
...
(x = 0,y = 32768) ----- (x = 32768,y = 32768)

Tags

Optical center: 0

Defines the horizontal and vertical position of the optical axis of the lens within the sensor plane (full viewed image) (called image center below) in the normalized coordinate system defined in the previous description.

An offset of (16384; 16384) therefore means that the optical center of the circular projection is horizontally and vertically centered in the sensor image (should be the normal case).

length = 4+n 2 Byte	tag = 0 2 Byte
x;y n Bytes	
16	32

x,y (string: 5;5): specify the position of the optical center x;y
x E 0 ... 32768
y E 0 ... 32768

Example:
x;y = "16384;16384"
-> x = 16384, y = 16384 -> lens is centered

Tags

Rotation symmetric transfer function: 1

The lens curve is assumed to be rotation symmetric

length = 4+n 2 Byte	tag = 1 2 Byte
radius[0];angle[0];radius[1];angle[1]... n Bytes	
16	32

lens transfer function:
Specifices a tuple for a set of points (radius on the sensor, the same coordinate system is used as before and a angle of incidence relativ to the optical axis)

Optimal interpolation between the points can be achived with natural splines

lens transfer function (string: 5;3.6;5;3.6 ...):
lens transfer function =
"7189;20.469667;13815;40.049053;17223;50.729707;20151;60.518720;21646;65.859047"
-> p[0] = (radius = 7189, angle of incidence = 20.469667°)
-> p[1] = (radius = 13815, angle of incidence = 40.049053°)
-> p[2] = (radius = 17223, angle of incidence = 50.729707°)
-> p[3] = (radius = 20151, angle of incidence = 60.518720°)
-> p[4] = (radius = 21646, angle of incidence = 65.859047°)

-> for a radius bigger than the last point the behavoiur of the lens is undefined (should be masked out in black on the client)

CONF_LOW_LIGHT_MIN_FPS

Tag code		NumDes	Message	SNMP Support
0x0ad8		no	no	no

Payload Structure

length 2 Byte	tag 2 Byte
payload length Bytes ~4...	
length 2 Byte	tag 2 Byte
payload length Bytes ~4...	
16	32

Generic description

The format has an internal tagged structure.
Every tagged command consists of an id and a length field + payload. Only read is supported
allows to query information about the ids present in CONF_VIDEO_INPUT_FORMAT_EX.

Tags

Basic verbose of CONF_VIDEO_INPUT_FORMAT_EX (must always be present): 0

Map CONF_VIDEO_INPUT_FORMAT_EX ids to width, height and framerate. The length of this tag may increase in future versions.

length 2 Byte		tag = 0 2 Byte	
id 1 Byte	additional info bits 1 Byte	rotationOptions 1 Byte	reserved 1 Byte
width 4 Bytes			
height 4 Bytes			
framerate_mHz 4 Bytes			
optional: framerateMin_mHz 4 Bytes			
8	16	24	32

id: 0..255: all available ids can be set via CONF_VIDEO_INPUT_FORMAT_EX defines (Video Format Id Byte [2])
id = 0, special id to signal availability of auto mode
additional 8 info bits:
0 bit (defines if the picture is cropped) 0 or 1: if the crop is set to one the view will be changed when switching between different resolutions takes place
1-3 bit nr of HDR exposure-1 0-> 1 exposure,1-> 2 exposure ...
4 bit: defines if custom rotation is supported (rotation low and heigh byte in CONF_VIDEO_INPUT_FORMAT_EX) 5-7 bit reserved
width: maximum available picture width for encoding
height: maximum available picture height for encoding
framerate: maximum available framerate for encoding
rotationOptions:
rotate 0° no mirror = 0,
rotate 0° mirror = 1,
rotate 90° no mirror = 2,
rotate 90° mirror = 3,
rotate 180° no mirror = 4,
rotate 180° mirror = 5,
rotate 270° no mirror = 6,
rotate 270° mirror = 7
8 bits
0 bit = 1 -> rotate 0° no mirror is supported
1 bit = 1 -> rotate 0° mirror is supported
2 bit = 1 -> rotate 90° no mirror is supported
...

Example:
rotationOptions = 0x44
-> bit 2 and bit 6 are available (of bit 0...7)
-> rotate 90° no mirror = 2 and rotate 270° no mirror = 6 are supported

36 Bytes			

encBaseModeId: id used in CONF_VIDEO_H264_ENC_BASE_OPERATION_MODE

height: video format height of base mode with encBaseModeId 0 -> height is not fixed

width: video format width of base mode with encBaseModeId 0 -> width is not fixed

copy: base mode is copy of an other stream

sd: base mode is sd, base mode resolution is determined by encoder profile

sdFramerateDependent: base mode resolution depends on frame rate

crop: base mode is a cropped view

skip: base mode is frame rate reduced (applies a skip on the full frame rate)

roi: base mode is a region of interest stream typically ptz is supported

ptz: base mode allows ptz

dualStream: base mode supports "dual stream" two encoders are used for the stream (e.g. 2 different ptz views are possible)

exclusive: only used in combination with 'dualStream' property. Indicates if the additional stream of the 'dual stream' is for exclusive access (only one client at a time) or not.

CONF_VIDEO_STATIC_SCENE_REGIONS

Tag code	NumDes	Message	SNMP Support
0x0623	line	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	static encoding categories see
Write	p_octet	access_right_service	static encoding categories see

Payload Structure

The actual payload of this command consist of a sequence of variable length records, each specifying a region and a corresponding category to be used during encoding. The region is characterized by a mandatory rectangle and optionally a shape. Up to 8 regions and in total up to 96 32-bit data for shapes are supported. Depending on the firmware version the shape data may be ignored. In this case the rectangle is used instead. This may also happen, if the restrictions indicated below are violated by the shape data.

Normally the "background" category is used for unimportant parts of the scene and the "object" category for important ones. For this two categories, specific quality adjustments can be defined via the encoding profile of every encoder. An area not belonging to any region is implicitly assigned to the "Default" category with no specific adjustments. The forth category is currently assigned via the VIDEO_ENC_TEMP_QUANT_ADJ command separately for each encoder.

Note, that by using overlapping regions, more than one category can be assigned to some areas of the scene. In this case the category with the best quality adjustment for an encoder takes precedence. Therefore it may be usefull to assign the "Default" category explicitly to some regions.

Record Structure

		16				32			
Preset id only valid for a Dome 8 Bits	reserved 6 Bits	ex 2	reserved 5 Bits	ca 2	s 1	r 1	N 7 Bits

reserved

set to 0

exclude

This bitmask indicates for which encoders this area shall NOT be used. The bits are allocated according to the the relative coder number starting with the rightmost bit (LSB) for the relative coder number 1.

reserved

set to 0

category

By default the complete scene is assumed to belong to the "default" category.

Values:

Default	0
Background	1
Objects	2
Reserved	3

shrink

Depending on the encoding resolution, the quality may only be adjusted on quite a coarse grid. This bit allows to specify whether the required rounding shall be performed by shrinking or enlarging the specified region.

Values:

enlarge as needed	0
shrink as needed	1

reserved

set to 0

N

This field indicates the number of 32-bit items defining the optional shape of this region and therefore also specifies indirectly the total size of this record ($12 + N * 4$ octets). For compatibility with future version of this RCP PLUS specification, clients SHOULD set this item to 0 for any region which they define or modify, but keep it and the corresponding shape data unmodified for regions they don't change.

hPos/vPos of vertex 1, 2, ..., N

N 32-bit items used for shape data. Each item describes a vertex of a polygonal shape boundary in the order as included in the record (the closing edge between vertex N and vertex 1 is added automatically). The vertices should all be different and the edges between them should have no point in common beside the vertex between them. (If the resulting area inside the polygon is not single connected the behaviour is undefined)

Coordinate System

The rectangles and the future shapes are specified via a virtual coordinate system with a nominal range of $0..32768 \times 0..32768$ for the usable sensor area (or incoming video). All rectangles and shapes should be completely inside this area, otherwise, the exact behaviour is undefined.

0x0bf4	-	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_minimal	not supported

The command returns which video input lines are virtual and which is the associated physical line. A physical line has its own video signal - that's the usual case. A virtual line is derived from a physical line and supports only a subset of the RCP commands compared to a physical line. Some commands only make sense on physical line (e.g. brightness, contrast, ...). Those fail on virtual lines and must be applied on the associated physical line instead. The required information can be read out using this command.

Virtual lines are introduced to provide a second view on an existing physical line. This is useful e.g. to have a dewarped image on a 180 or 360 degree camera. Furthermore each virtual line has its own video analysis meta data stream (a.k.a. "VCD stream") which is also derived from the image on the physical line but already preprocessed (cropped, dewarped, ...) to fit the view on the virtual line.

Payload Structure

No. of Entries 2 Byte	Length per Entry 2 Byte
First Entry 4 Byte	
... 4 Byte	
Last Entry 4 Byte	

No. of Entries

The number of virtual line descriptions.

Length per Entry

The number of bytes per line description. This value is currently 4 but may be increased later when more information per entry must be provided. New fields will be appended to the entry and should be ignored by the client when unknown.

Entry

No. of virtual Line 2 Byte	No. of physical Line 2 Byte
-------------------------------	--------------------------------

No. of virtual Line

The number of the line which is a virtual line. Counting starts as usual from 1. Every video input line is either a physical line (default) or a virtual line. All lines listed here are virtual lines.

No. of physical Line

The number of the physical line which is associated to the named virtual line in the previous field. This line must be addressed for RCP commands that fail on the virtual line.

CONF_VIDEO_LINE_DEWARPING_MODE

Tag code		NumDes	Message	SNMP Support
0x0bf6		line (starting from 1)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Gets the dewarping mode of a virtual line. octet[0] is the selected id. If the request is applied to a physical line, the value 0 is returned. (Do not check the length of the command in the future may additional tags will be added). If only the first Byte is set for addition parameters defaults will be used. See CONF_VIDEO_LINE_DEWARPING_MODE_CAPS for possible values.	
			Sets the dewarping mode of a virtual line octet[0] sets the selected id. (Do not check the length of the command in the future may additional tags will be added). If only the first Byte is set for addition parameters defaults will be used. See CONF_VIDEO_LINE_DEWARPING_MODE_CAPS for possible values.

CONF_VIDEO_OUT_STANDARD_SPEC

Tag code	NumDes	Message	SNMP Support
0x0706	yes: corresponding video output standard number (see CONF_VIDEO_OUT_STANDARD)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	obtain video output standard specification
Write	p_octet	access_right_service	configure video output standard (use zero payload size to reset to default)

Payload Structure

pixelClock

pixel clock frequency in Hz

width

width of active screen in pixel

height

height of active screen in pixel

border_lft

width of the additional border left of the active screen

border_rgt

width of the additional border right of the active screen

border_top

height of the additional border above the active screen

border_bot

height of the additional border below active screen

retrace_width

duration of horizontal blanking period in pixel clock cycles

retrace_height

duration of vertical blanking period in scan line units

hsync_start

start of the horizontal sync impulse in pixel clock cycles past the beginning of the horizontal blanking period (signed 2s-complement)

vsync_start

start of the vertical sync impulse in scan lines past the beginning of the vertical blanking period (signed 2s-complement)

hsync_width

duration of the horizontal sync impulses in pixel clock cycles

vsync_width

duration of the vertical sync impulses in scan line units

border_width

(minimum) border width between the active subscreens in split screen mode

border_height

(minimum) border height between the active subscreens in split screen mode

border_red

intensity of the red channel of the border colour around the active screen and between subscreens

border_green

corresponding intensity of the green channel

border_blue

corresponding intensity of the blue channel

reserved

reserved for future extensions

hsync mode

polarity of horizontal sync signal

Values:

positive polarity (active high)	0
negative polarity (active low)	1

sync signals

Values:

separate H-/V-sync signals	0
composite sync signal	1
illegal	2
composite sync on green	3

reserved

reserved for future extensions

Notes

In order to be selectable via CONV_VIDEO_OUT_STANDARD or CONV_VIDEO_OUT_CURRENT_SPEC, the corresponding parameters must comply with the currently active output device limits (see CONF_VIDEO_OUT_MONITOR_SPEC).

The resulting scan line frequency can be calculated by:
 $f_{hsync} = \text{pixelClock} / (\text{width} + \text{border_lft} + \text{border_rgt} + \text{retrace_width})$
The resulting vertical refresh frequency can be calculated by
 $f_{vsync} = f_{hsync} / (\text{height} + \text{border_top} + \text{border_bot} + \text{retrace_height})$

Negative values for sync_start and/or vsync_start are not guaranteed to work.

Depending on the hardware, the actual border colour may be different from the selected one and even different between the border around the active screen and the border between the subscreens in split screen mode.

Not all sync mode combinations are supported by the hardware.

The values returned on read may be different from the values set via the last write access, even if the supplied values are within the range supported by the output display as configured via CONF_VIDEO_OUT_MONITOR_SPEC.

h-sync active low, v-sync active high	2
h-sync active high, v-sync active low	4
h-sync active low, v-sync active low	8

reserved

reserved for future extensions

Notes

In addition to the specified limits, default modes corresponding to the respective physical connector (e.g. standard VGA timing on a VGA connector, PAL/NTSC on BNC) are typically also assumed to be supported by the display device. The device will only allow video output timings (see `CONF_VIDEO_OUT_CURRENT_SPEC`, `CONF_VIDEO_OUT_STANDARD`) within these limits and may use the mentioned default timings as fallback values.

bg_luma

background color: 8 bit luma (Y)

bg_chroma

background color: 2 x 4 bit chroma (U/V); "lower 4 bit" = U, "upper 4 bit" = V

attributes

Values:	
Bit 8	Use custom font and background color given in bg_luma, bg_chroma, font_luma and font_chroma (0=off, 1=on)
Bit 10	Big text background box (0=off, 1=on)

font_luma

font color: 8 bit luma (Y)

font_chroma

font color: 2 x 4 bit chroma (U/V); "lower 4 bit" = U, "upper 4 bit" = V

reserved

Reserved fields must be written as 0

CONF_STAMP_DEC_FREEZE_STRING

Tag code	NumDes	Message	SNMP Support
0x092f	no	yes	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	string displayed on the local monitor if DEC_SHOW_FREEZE is enabled and no vido data is coming in
Write	p_string	access_right_service	string displayed on the local monitor if DEC_SHOW_FREEZE is enabled and no vido data is coming in

CONF_STAMP_ATTR_NO_LINK

Tag code	NumDes	Message	SNMP Support
0x0935	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	12 bytes: byte 0= pos x (0-255), byte 1= pos y (0-255), byte 3-11 reserved (set to zero)
Write	p_octet	access_right_service	12 bytes: byte 0= pos x (0-255), byte 1= pos y (0-255), byte 3-11 reserved (set to zero)

CONF_STAMP_NO_LINK_STRING

Tag code	NumDes	Message	SNMP Support
0x0931	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	string displayed on the local monitor if there is no ethernet link
Write	p_string	access_right_service	string displayed on the local monitor if there is no ethernet link

CONF_ENABLE_OSD

Tag code		NumDes	Message	SNMP Support
0x0810		no	no	no
Datatype		Access Level	Description	
Read	octet	access_right_minimal	osd on trimedia	
Write	octet	access_right_service	enable osd on trimedia	

CONF_OSD_ACCESS

Tag code	NumDes	Message	SNMP Support
0x098a	0: print to all coders, else, print only to selected absolute coder	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported
Write	p_octet	access_right_service	access to the OSD via RCP command

Up to version 4.50, this command only applies to decoders to display text onto the video output. The num field carries the video output number. A value of 0 indicates that the text should be displayed on all screens. Remind that the num value numbering scheme takes quad mode into account for the lines where quad is possible, even if quad mode is not active. (E.g. to have an OSD stamped into the fourth line of a VIP X1600 XFMD, you need to use num value of 10). To delete previously submitted strings, send an empty string (not space characters!).

From version 4.50 on this command applies to encoders as well. In that case, the encoder will embed the text information into the RTP data stream to be overlayed by the receiving decoder. The attribute and flag fields are not applicable to the decoder's video output. The num field applies to the video input number.

Payload Structure

ID 2 Byte		len 2 Byte	
x 1 Byte	y 1 Byte	bg_luma 1 Byte	bg_chroma 1 Byte
attributes 4 Bytes			
font_luma 1 Byte	font_chroma 1 Byte	flags 2 Byte	
String 1 1 Byte	N x 1 Byte	String N 1 Byte	

ID

Tag ID, for addressing different strings. Values 0x04-0x08 are possible.

len

Length of the complete payload in bytes. Maximum length is 64 bytes.

x

X-Position (0...255) where the string should be displayed (0 is left)

y

Y-Position (0...255) where the string should be displayed (0 is up)

bg_luma

background color: 8 bit luma (Y)

bg_chroma

background color: 2 x 4 bit chroma (U/V); "lower 4 bit" = U, "upper 4 bit" = V

attributes	
<u>Values:</u>	
Bit 8	Use custom font and background color given in bg_luma, bg_chroma, font_luma and font_chroma (0=off, 1=on)
Bit 10	Big text background box (0=off, 1=on)
Bit 11	Centered display (0=off, 1=on)
Bit 13-15	Font size (0=small, 1=big)
Bit 20	Draw a box around the text or transparent text background (0=box, 1=transparent)

font_luma

font color: 8 bit luma (Y)

font_chroma

font color: 2 x 4 bit chroma (U/V); "lower 4 bit" = U, "upper 4 bit" = V

flags

Values:

Bit 0	Interpret text as unicode characters (UTF-16)
-------	---

String 1 - N

The string value which should be displayed

CONF_OSD_POS

Tag code	NumDes	Message	SNMP Support
0x0ae0	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	access to the OSD via RCP command
Write	p_octet	access_right_service	access to the OSD via RCP command

Set or get the position of OSD objects (see CONF_OSD_ACCESS). For "write" the num field carries the video number; 0 indicates that the string positions on all video lines will be set.

WRITE

Payload Structure

ID	x	y
2 Byte	1 Byte	1 Byte

ID

Tag ID, for addressing different strings. Values 0x04-0x08 are possible.

x

X-Position (0...255) where the string should be displayed (0 is left)

y

Y-Position (0...255) where the string should be displayed (0 is up)

READ

Payload Structure (request)

ID
2 Byte

Payload Structure (reply)

ID	x	y
2 Byte	1 Byte	1 Byte

ID

Tag ID, for addressing different strings. Values 0x04-0x08 are possible.

x

X-Position (0...255) where the string is located (0 is left)

y

Y-Position (0...255) where the string is located (0 is up)

CONF_AUDIO_INPUT_LEVEL

Tag code		NumDes	Message	SNMP Support
0x000a		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets current level of audio input. Range: 0 to AUDIO_INPUT_MAX	
Write	dword	access_right_service	sets level of audio input. Range: 0 to AUDIO_INPUT_MAX	

CONF_AUDIO_OUTPUT_LEVEL

Tag code		NumDes	Message	SNMP Support
0x09b7		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets level of audio output. Range: 0 to AUDIO_OUTPUT_MAX	
Write	t_dword	access_right_service	sets level of audio output. Range: 0 to AUDIO_OUTPUT_MAX	

CONF_AUDIO_ON_OFF

Tag code		NumDes	Message	SNMP Support
0x000c		no	no	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	0 = audio mode is not set, 1 = audio mode is set	
Write	flag	access_right_service	set audio mode (0=off, 1=on) (has no effect on a running recording, to have the effect in recording, restart of recording is nessessary)	

CONF_AUDIO_STARTUP_SOUND

Tag code		NumDes	Message	SNMP Support
0x09b6		no	no	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	turn on/off audio startup sound	
Write	flag	access_right_service	turn on/off audio startup sound	

CONF_AUDIO_NOTIFICATION_SOUND

Tag code		NumDes	Message	SNMP Support
0x0c77		sound type: 1=privacy mode sound, ...	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	read status of audio notification sound (only applicable on certain devices). 0 = do not play sound; 1 = play sound	
Write	f_flag	access_right_service	switch audio notification sound on/off (only applicable on certain devices). 0 = do not play sound; 1 = play sound	

CONF_AUDIO_INPUT

Tag code		NumDes	Message	SNMP Support
0x09b8		audio line	no	no
Datatype		Access Level	Description	
Read	dword	access_right_minimal	0=Line, 1=Mic	
Write	dword	access_right_service	0=Line, 1=Mic, 2=Mute (only supported by arm based products)	

CONF_AUDIO_OUTPUT

Tag code		NumDes	Message	SNMP Support
0x09b9		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	0=Decoder, 1=Sine, 2=Loop, 3=Mute, 4=Sample	
Write	t_dword	access_right_service	0=Decoder, 1=Sine, 2=Loop, 3=Mute, 4=Sample	

CONF_AUDIO_INPUT_MAX

Tag code		NumDes	Message	SNMP Support
0x09ba		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets the maximum input level that can be adjusted	
Write	%	access_right_service	%	

CONF_AUDIO_OUTPUT_MAX

Tag code		NumDes	Message	SNMP Support
0x09bb		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets the maximum output level that can be adjusted	
Write	%	access_right_service	%	

CONF_AUDIO_MIC_LEVEL

Tag code		NumDes	Message	SNMP Support
0x09bc		audio line	no	no
Datatype		Access Level	Description	
Read	dword	access_right_minimal	gets level of mic input. Range: 0 to AUDIO_MIC_MAX	
Write	dword	access_right_service	sets level of mic input. Range: 0 to AUDIO_MIC_MAX	

CONF_AUDIO_MIC_MAX

Tag code	NumDes	Message	SNMP Support
0x09bd	audio line	no	no
Datatype	Access Level	Description	
Read	dword	access_right_minimal	gets the maximum mic level that can be adjusted
Write	%	access_right_service	%

CONF_AUDIO_LOUDSPEAKER_ON_OFF

Tag code	NumDes	Message	SNMP Support
0x09be	audio line	no	no
Datatype	Access Level	Description	
Read	flag	access_right_minimal	Gets Loudspeaker if on or off. 0=off, 1=on.
Write	flag	access_right_service	Sets Loudspeaker on or off. 0=off, 1=on.

CONF_AUDIO_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x09bf		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	gets options for Audio, Bit 0=Line In, Bit 1=Line Out, Bit 2=Mic, Bit 3=Loudspeaker	
Write	%	access_right_service	%	

CONF_AUDIO_INPUT_PEEK

Tag code		NumDes	Message	SNMP Support
0x09c6		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the max iabs of the audio input signal (clears the value)	
Write	t_dword	access_right_service	get the max iabs of the audio input signal (clears the value)	

CONF_AUDIO_OUTPUT_PEEK

Tag code		NumDes	Message	SNMP Support
0x09c7		audio line	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the max iabs of the audio output signal (clears the value)	
Write	t_dword	access_right_service	get the max iabs of the audio output signal (clears the value)	

CONF_NBR_OF_AUDIO_OUT

Tag code		NumDes	Message	SNMP Support
0x01d9		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of audio outputs	
Write	%	access_right_service	%	

CONF_NBR_OF_AUDIO_IN

Tag code		NumDes	Message	SNMP Support
0x01d8		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of audio inputs	
Write	%	access_right_service	%	

CONF_AUDIO_AAC_BITRATE

Tag code		NumDes	Message	SNMP Support
0x0b9a		audio line (1 or 2)	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	read the bitrate of the AAC encoder (only value of 48000 and 80000 are supported) for the line given by num	
Write	t_dword	access_right_service	set the bitrate for the AAC encoder (only value of 48000 and 80000 are supported) on the line given with the num parameter	

CONF_VIRTUAL_AUDIO_LINES

Tag code	NumDes	Message	SNMP Support
0x0bf5	-	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_minimal	not supported

The command returns which audio input lines are virtual and which is the associated physical line. A physical line is physical audio input - that's the usual case. A virtual line is just a copy of a physical line and supports only a subset of the RCP commands compared to a physical line. Some commands only make sense on physical line (e.g. input volume). Those commands fail on virtual lines and must be applied on the associated physical line instead. The required information can be read out using this command.

Virtual lines are introduced to provide a copy to an existing physical line. A single physical audio input can be associated to multiple video input lines. This keeps our known behaviour to have an audio line with the same number as the video line.

Payload Structure

No. of Entries	Length per Entry
2 Byte	2 Byte
First Entry	
4 Byte	
...	
4 Byte	
Last Entry	
4 Byte	

No. of Entries

The number of virtual line descriptions.

Length per Entry

The number of bytes per line description. This value is currently 4 but may be increased later when more information per entry must be provided. New fields will be appended to the entry and should be ignored by the client when unknown.

Entry

No. of virtual Line	No. of physical Line
2 Byte	2 Byte

No. of virtual Line

The number of the line which is a virtual line. Counting starts as usual from 1. Every audio input line is either a physical line (default) or a virtual line. All lines listed here are virtual lines.

No. of physical Line

The number of the physical line which is associated to the named virtual line in the previous field. This line must be addressed for RCP commands that fail on the virtual line.

CONF_EXTERNAL_CLIENTS_LIST

Tag code	NumDes	Message	SNMP Support
0x0c9d	video line	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	gets a list of installed external clients
Write	p_octet	access_right_service	unsupported

CONF_EXTERNAL_CLIENT

Tag code	NumDes	Message	SNMP Support
0x0c9e	see detailed description	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	two external client inst are available. This commands starts/stops an external client on one inst.

This command lists information about all running external clients or about a specific external client. To get the information of all running clients set the num parameter to 0xFFFF; To get the information of a specific external client the num parameter is set to:

1.) video app: 1. Bytes video line (1...n), 2. Bytes client inst (0,1)

2.) user app: 1. null, 2. Bytes client inst (0-16)

The response payload consist of a sequence of

16			
line	inst	length	name
1 Byte	1 Byte	1 Byte	length Bytes

CONF_EXTERNAL_CLIENT_EVENT

Tag code	NumDes	Message	SNMP Support
0x0cdd	-	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_internal	system-internal callback (passed on by CExtensionManager) to handle some extension event
Write	p_octet	access_right_internal	system-internal callback (passed on by CExtensionManager) to handle some extension event

CONF_ALARM_INPUT_LH_VAL

Tag code	NumDes	Message	SNMP Support
0x008d	alarm input	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	1=alarm pin high active; 2=alarm pin low active
Write	t_octet	access_right_service	1=set alarm pin high active; 2=set alarm pin low active

CONF_INPUT_PIN_NAME

Tag code	NumDes	Message	SNMP Support
0x0108	alarm in	no	no
Datatype	Access Level	Description	
Read	p_unicode	access_right_minimal	read the description for an input alarm
Write	p_unicode (max 32 unicode characters)	access_right_service	set the description for an input alarm

CONF_ALARM_INPUT_SUPERVISED

Tag code	NumDes	Message	SNMP Support
0x0b87	alarm input (beginning with '1')	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	1= alarm pin is set to supervised mode; 0= alarm pin is set to normal mode (non-supervised)
Write	t_octet	access_right_service	1=set alarm pin to supervised mode; 0=set alarm pin to normal mode (non-supervised)

CONF_ALARM_INPUT_CAPABILITIES

Tag code	NumDes	Message	SNMP Support
0x0c6a	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read capabilities of the available alarm inputs; 1st DWORD: number of available alarm inputs; 2nd DWORD: capabilities of the first alarm input; 3rd DWORD: capabilities of the second alarm input; ... Each capability is signalled as one bit within the corresponding DWORD: bit 0 = supervised mode possible, bit 1-31 = reserved
Write	p_octet	access_right_service	not supported

CONF_EVENT_SCRIPT

Tag code	NumDes	Message	SNMP Support
0x09f3	no	yes (returns script syntax error when not successful)	no
Datatype	Access Level	Description	
Read	p_octet	access_right_live	get the compressed Alarm Task Script
Write	p_octet	access_right_service	write a new Alarm Task Script; note: script must be compressed (zipped)

CONF_VCD_OPERATOR_PARAMS

Tag code		NumDes	Message	SNMP Support
0x0a1b		video line	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read parametrization of vcd operator which corresponds to line	
Write	p_octet	access_right_service	configures the vcd manager. if configuration fails an error is returned.	

CONF_VIPROC_RE_TASK_NAMES

Tag code		NumDes	Message	SNMP Support
0x0b2b		video line	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read the current rule engine task names which corresponds to line	
Write	p_octet	access_right_service	not supported, read only	

This command reads out the task names of the current configured rule engine.

Response Structure

Algorithm type		Number of tasks
2 Byte		2 Byte
Task id	Task type	Name
1 Byte	1 Byte	64 Byte
...		
Task id	Task type	Task name
1 Byte	1 Byte	64 Byte

Algorithm type

- 1 IVA algorithm
- 2 IVA flow algorithm
- 4 Motion algorithm

Number of tasks

Number of configured user tasks.

Task id

Id of the user task. Defines the alarm bit of the CONF_VIPROC_ALARM message.

Task type

- 1 Object in field
- 2 Line crossing
- 3 Loitering
- 5 ConditionChange
- 6 FollowingRoute
- 7 Tampering
- 8 RemovedObject
- 9 IdleObject
- 10 EnteringField
- 11 LeavingField
- 11 LeavingField
- 13 SimilaritySearch
- 14 CrowdDetection
- 15 Counter
- 16 BEV people counter
- 17 Line Counter
- 18 Occupancy
- 19 Man over Board
- 40 FlowInField
- 41 CounterFlowInField
- 42 MotionInField

Task name

The task name is UTF8 encoded and maximal 64 byte.

CONF_VIPROC_DETECTOR_PARAMS

Tag code		NumDes	Message	SNMP Support
0x0c96		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	reads VCA detector params	
Write	p_octet	access_right_service	sets VCA detector params	

CONF_RAW_IMAGE

Tag code	NumDes	Message	SNMP Support
0x0c98	video line	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	not supported

In Payload Structure

Available Scalers

0x0001	VCA Scaler (default)
--------	----------------------

Available formats

0x0000	Raw YUV (default)
0x0001	TIFF encoded raw

The Raw YUV format begins with the following header:

Image width 4 Byte
Image height 4 Byte
YUV format 4 Byte

The YUV format is encoded as an integer with the following meaning...

Available formats

1	420 planar, YYYY...UUUU...VVVV
-1	420 chroma interleaved, YYYY....UVUVUV
2	422 planar, YYYY...UUUU...VVVV
-2	422 chroma interleaved, YYYY....UVUVUV

Image width 4 Byte	
Image height 4 Byte	
8	24

CONF_ALARM_CONNECT_TO_IP_STR

Tag code	NumDes	Message	SNMP Support
0x0081	destination IP number	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the alarm IP using string notation (xxx.xxx.xxx.xxx)
Write	p_string	access_right_service	set alarm IP using string notation (xxx.xxx.xxx.xxx)

CONF_ALARM_CONNECT_TO_IP

Tag code	NumDes	Message	SNMP Support
0x0041	destination IP number	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the connect on alarm event IP address
Write	t_dword	access_right_service	specify the connect on alarm event IP address

CONF_NBR_OF_ALTERNATIVE_ALARM_IPS

Tag code	NumDes	Message	SNMP Support
0x0303	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get the number of available alarm ip addresses (total presets)
Write	void	access_right_service	not supported

CONF_AUTO_DISCONNECT_TIME

Tag code	NumDes	Message	SNMP Support
0x030d	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	0=no auto disconnect; 0
Write	t_dword	access_right_service	0=no auto disconnect; 0

CONF_DEFAULT_CONNECTION_MODE

Tag code	NumDes	Message	SNMP Support
0x0289	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	get the default connection mode: 0=MPEG2, 1=MPEG4, 2=MPEG4/AVC, 3=JPEG, 4=ANY
Write	t_octet	access_right_service	sets the default connection mode: 0=MPEG2, 1=MPEG4, 2=MPEG4/AVC, 3=JPEG, 4=ANY

CONF_STD_MEDIA_CONNECTION_DIRECTION

Tag code	NumDes	Message	SNMP Support
0x030c	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	=0: outgoing media for alarm connections; =1: req. incoming media for alarm connections; =2: req. bidirectional media for alarm connections
Write	t_octet	access_right_service	=0: outgoing media for alarm connections; =1: req. incoming media for alarm connections; =2: req. bidirectional media for alarm connections

CONF_STD_MEDIA_ENCAPSULATION_PROTOKOL

Tag code		NumDes	Message	SNMP Support
0x0309		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	defines the standard media encapsulation protokol: 1=RTP over UDP, 2=TCP	
Write	t_octet	access_right_service	defines the standard media encapsulation protokol: 1=RTP over UDP, 2=TCP	

CONF_DEFAULT_CAM

Tag code		NumDes	Message	SNMP Support
0x01af		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	reads the default camera for alarm connections	
Write	t_octet	access_right_service	defines the default camera for alarm connections	

CONF_ALARM_CONNECTION_DESTINATION_PORT

Tag code		NumDes	Message	SNMP Support
0x0a15		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	returns the network destination port on outgoing alarm connections	
Write	t_word	access_right_service	selects the destination network port for outgoing alarm connections; all other than 1756 (default RCP port) will use the HTTP tunneling protocol. In this case, this must be the HTTP/HTTPS port of the called host.	

CONF_ALARM_CONNECTION_USE_SSL

Tag code	NumDes	Message	SNMP Support
0x0a16	no	no	no
Datatype	Access Level	Description	
Read	flag	access_right_minimal	use RCP SSL for outgoing alarm connections
Write	flag	access_right_service	use RCP SSL for outgoing alarm connections

CONF_CONNECT_URL

Tag code	NumDes	Message	SNMP Support
0x0a1e	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	get the connect url
Write	p_string	access_right_service	set the connect url

CONF_VIDEO_ALARM_STATE

Tag code	NumDes	Message	SNMP Support
0x01c2	video line	yes	yes
Datatype	Access Level	Description	
Read	flag	access_right_minimal	0=video alarm is off; 1=video alarm is on (no video signal detected at video input)
Write	void	access_right_minimal	not supported

CONF_INPUT_PIN_STATE

Tag code		NumDes	Message	SNMP Support
0x01c0		alarm in	yes	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	0=alarm input off; 1= alarm input on	
Write	void	access_right_minimal	not supported	

CONF_MOTION_ALARM_STATE

Tag code		NumDes	Message	SNMP Support
0x01c3		video line	yes	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	0=motion alarm off; 1=motion alarm on (at elast one of the CONF_VIPROC_ALARM alarmbit (except the video loss alarm) is set	
Write	flag	access_right_minimal	not supported	

CONF_RELAY_OUTPUT_STATE

Tag code		NumDes	Message	SNMP Support
0x01c1		relay output	yes	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	returns the current logical level of an relay output	
Write	flag	access_right_user	set the logical level of an relay output	

CONF_RELAY_OUTPUT_MODE

Tag code	NumDes	Message	SNMP Support
0x0bdb	output number	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	1: output pin is "normally open"; 2: output pin is "normally closed"; (Notice: the relay output mode can also be set via the Alarm Task Script Language)
Write	t_octet	access_right_service	1: set output pin to "normally open"; 2: set output pin to "normally closed"; (Notice: the relay output mode can also be set via the Alarm Task Script Language; should not be used in parallel)

CONF_NBR_OF_ALARM_IN

Tag code	NumDes	Message	SNMP Support
0x01db	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of installed alarm input contacts (possible masterswitch included)
Write	void	access_right_internal	not supported

CONF_NBR_OF_ALARM_OUT

Tag code	NumDes	Message	SNMP Support
0x01dc	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of installed alarm output contacts
Write	void	access_right_internal	not supported

CONF_NBR_OF_MOTION_DETECTORS

Tag code		NumDes	Message	SNMP Support
0x09af		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of installed motion detectors	
Write	%	access_right_internal	%	

CONF_HD_MGR_SIGNAL_ALARM

Tag code		NumDes	Message	SNMP Support
0x0915		no	no	no
Datatype		Access Level	Description	
Read	-	access_right_minimal	not supported	
Write	flag	access_right_service	signal alarm: only one alarm per second is allowed,	

CONF_VIRTUAL_ALARM_STATE

Tag code		NumDes	Message	SNMP Support
0x0a8b		virtual alarm number	yes	yes
Datatype		Access Level	Description	
Read	flag	access_right_minimal	0=virtual alarm off; 1=virtual alarm on	
Write	flag	access_right_user	0=virtual alarm off; 1=virtual alarm on	

CONF_SET_VIRTUAL_ALARM_ID

Tag code	NumDes	Message	SNMP Support
0x0b41	virtual alarm number	no	no
Datatype	Access Level	Description	
Read	p_unicode (max 32 unicode characters)	access_right_minimal	not supported
Write	p_unicode (max 32 unicode characters)	access_right_service	set virtual alarm with num ## to active and puts unicode string in all meta data stream as an alarm text event (will be recorded in all active recordings). At maximum 31 unicode characters are accepted (32th character has to be the termination character), longer input will be truncated.

CONF_NBR_OF_VIRTUAL_ALARMS

Tag code	NumDes	Message	SNMP Support
0x0a0d	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	number of virtual alarm inputs
Write	t_dword	access_right_internal	not supported

CONF_MANIPULATION_ALARM_STATE

Tag code	NumDes	Message	SNMP Support
0x0af0	manipulation alarm nbr	yes	no
Datatype	Access Level	Description	
Read	flag	access_right_minimal	0=manipulation alarm off; 1=manipulation alarm on (notice: for supervised alarm inputs the according CONF_INPUT_PIN_STATE also indicates an alarm in this case)
Write	flag	access_right_internal	not supported

CONF_NBR_OF_MANIPULATION_ALARMS

Tag code		NumDes	Message	SNMP Support
0x0af1		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	number of manipulation alarms	
Write	t_dword	access_right_internal	not supported	

CONF_VIRTUAL_ALARM_PARAMETER

Tag code	NumDes	Message	SNMP Support
0x0ba6	yes (virtual alarm nbr 1 ... n)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read not supported, see detailed description
Write	p_octet	access_right_service	activate/deactivate virtual alarms with parameter, see detailed description

Payload Structure

flags 8 Bits	reserved 3 Bytes
alarm content handle 32 Bits	
pre alarm time 32 Bits	
post alarm time 32 Bits	
user data len 32 Bits	
user data 0 to 4000 Bytes ...	
...	

flags

Flags:			
ALARM_ACTIVATE	0x01	activate the alarm	
ALARM_DEACTIVATE	0x02	deactivate the alarm	
ALARM_SINGLE_SHOT	0x03	activate and then deactivate the alarm (ALARM_ACTIVATE ALARM_DEACTIVATE)	
ALARM_FILE_PROTECTION	0x04	protects the file, which contains the alarm video data (only on activate or shot)	
ALARM_IGNORE_ALARM_TIME_PARAMETER	0x08	the pre and post alarm time has no meaning, parameter from the record profiles will be used instead	
ALARM_USER_DATA_1X	0x10	user data will be recorded only once	

alarm content handle

handle for the alarm(required for deactivation or retrigger, returned in reply on activation) non zero value or zero for wild card in case of deactivate

pre alarm time

pre alarm time in seconds

post alarm time

post alarm time in seconds

user data len

length in bytes of the following user data, max 4000 bytes

user data

user data which will be recorded repeatedly, as long as the alarm is active or while within the post alarm time of the alarm

VIRTUAL_ALARM_PARAMETER

This command is used to trigger a virtual alarm along with parameters for alarm recording. The alarm can be activated, deactivated or triggered as single shot, which is an activate and deactivate within on command. Its also possible to trigger a silent alarm, by setting the activate and deactivate flag to zero. This works like a single shot alarm, the user data will be recorded and backups between the recordings will be scheduled, but the virtual alarm won't be triggered. If silent alarm is used, the num parameter doesn't choose the virtual alarm number, but it is mapped directly to the recording line. The command can have user data which can be recorded as meta data along to the video data. Also the pre and post alarm time can be specified but is only valid, if the alarm recording is done via backuped recording setup and the Flag ALARM_IGNORE_ALARM_TIME_PARAMETER isn't set. This will cause an alarm backup from the recording (primary or secondary, depending on the virtual alarm configuration and encoder index configuration) with this parameter, but the pre alarm time is limited by the max pre alarm time which is the same as the configured prealarm time of the secondary recording on the internal storage. It is also limited by the storage space of the internal storage. The max

pre alarm time is also the delay for the recording. That means the recording of the alarm file triggered by an alarm will be started after this delay expires. Until that time the records of that file are only available on the internal storage. When a new alarm is triggered by activate, the reply returns an alarm content handle (only on activation, not on single shot). The limit for open content handle at the same time per line (includes also deactivated alarms or alarm shots within the post alarm time) is 32. This handle can be used to deactivate the alarm later by sending this command with the handle in the payload or it can be used to retrigger the alarm with new user data. For retrigger the payload looks the same as for activate, except a valid handle is required. Only for deactivation or retrigger of the alarm, the handle is required for in payload. A valid handle is a non zero handle, if the handle is set to zero, it will be interpreted as wild card on deactivate, which will deactivate/close all active handles or as invalid. In case of activate, a new handle will be opened and returned in the reply, if the handle is invalid/zero. If a handle(or all handles) will be deactivated/closed, it will decay with the post alarm time. An alarm can also used on first activation to add the "protected" attribute to the file, which includes the record data of the alarm. The limit for pending intervals for protection are limited to 32 per line. Pending is an interval in the time from the occurrence of the protecting alarm and the backup of the alarm record data.

CONF_PIR_SENSITIVITY

Tag code		NumDes	Message	SNMP Support
0x0bbb		ignored	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_user	Sensitivity of PIR sensor: 0=disabled, 1=lowest..10=highest	
Write	t_octet	access_right_service	Sensitivity of PIR sensor: 0 = PIR disabled, 1 = lowest .. 10 = highest	

CONF_PIR_STATUS

Tag code		NumDes	Message	SNMP Support
0x0bbc		ignored	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_user	obsolete - Raw ADC value of the PIR sensor.	
Write	t_dword	access_right_service	not supported	

CONF_NBR_OF_PIR

Tag code		NumDes	Message	SNMP Support
0x0c1a		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of installed PIR sensors	
Write	t_dword	access_right_internal	not supported	

CONF_PIR_ALARM_STATE

Tag code		NumDes	Message	SNMP Support
0x0c1b		PIR sensor nbr	yes	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	0=PIR alarm off; 1=PIR alarm on	
Write	flag	access_right_internal	not supported	

CONF_ILLUMINATOR_OPTIONS

Tag code		NumDes	Message	SNMP Support
0x0c1c		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	returns the number of installed white-light illuminators and their capabilities; 1st WORD: number of illuminators; 2nd WORD: capabilities of first illuminator, 3rd WORD: capabilities of second illuminator..., etc.; Available capabilities: bit0=dimmable (by CONF_ILLUMINATION_INTENSITY)	
Write	p_octet	access_right_internal	not supported	

CONF_ILLUMINATOR_STATE

Tag code		NumDes	Message	SNMP Support
0x0c1d		illuminator nbr	yes	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get state of white-light illumination; 0=illuminator off; 1=illuminator on	
Write	t_dword	access_right_user	switch white-light illumination; 0=illuminator off; 1=illuminator on; (notice: to change the illumination intensity, see command CONF_ILLUMINATION_INTENSITY)	

CONF_ILLUMINATION_INTENSITY

Tag code		NumDes	Message	SNMP Support
0x0c22		illuminator nbr	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the white-light illumination intensity; range is from 1-100; 1->darkest; 100->brightest	
Write	t_word	access_right_user	set the white-light illumination intensity; range is from 1-100; 1->darkest; 100->brightest; (notice: to switch the illuminator on/off, use command CONF_ILLUMINATOR_STATE)	

CONF_VCA_BRIGHTNESS_INFO

Tag code		NumDes	Message	SNMP Support
0x0c25		video line	yes	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	luminance (1..255), the value 0 means N/A	
Write	p_octet	access_right_user	not supported	

CONF_VCA_SUGGESTED_FIREMASK

Tag code		NumDes	Message	SNMP Support
0x0c31		video line	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read suggested fire mask from algorithm (payload beyond this document)	
Write	t_octet	access_right_user	not supported	

CONF_RELAIS_NAME

Tag code		NumDes	Message	SNMP Support
0x0109		relay output	no	no
Datatype		Access Level	Description	
Read	p_unicode	access_right_minimal	read the description for a relay output	
Write	p_unicode (max 32 unicode characters)	access_right_service	set the description for a relay output	

CONF_RELAIS_SWITCH

Tag code		NumDes	Message	SNMP Support
0x0094		relay output	no	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	return the current relay state	
Write	flag	access_right_user	toggle the logical level of a relay output (0->1; 1->0) (notice: a flag payload value is not necessary, i.e. ignored)	

CONF_SERIAL_PORT_APP_VAL

Tag code		NumDes	Message	SNMP Support
0x01f1		physical port	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	0=serial port application is in terminal mode; 0xFF=serial port application is in transparent datamode; values 1-10: camera type mode; 0xF8=serial port application is in a mode where incoming conf_bicom commands are piped to the serial port, 0xF8 is only applicable on encoder devices and only for video line 1, for 0xF8 a device reboot is necessary!	
Write	t_octet	access_right_service	0=sets the serial port application in terminal mode; 0xFF=sets the serial port application in transparent datamode; values 1-10: sets to camera type mode; 0xF8=sets the serial port application into a mode where incoming conf_bicom commands are piped to the serial port, 0xF8 is only applicable on encoder devices and only for video line 1, for 0xF8 a device reboot is necessary!	

CONF_SERIAL_PORT_RATE

Tag code	NumDes	Message	SNMP Support
0x027e	physical port	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	bitrate=300; bitrate=600; bitrate=1200; bitrate=2400; bitrate=4800; bitrate=9600; bitrate=19200
Write	t_dword	access_right_service	bitrate=300; bitrate=600; bitrate=1200; bitrate=2400; bitrate=4800; bitrate=9600; bitrate=19200

CONF_SERIAL_PORT_BITS

Tag code	NumDes	Message	SNMP Support
0x027f	physical port	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	7=seven data bits; 8=eight data bits
Write	t_octet	access_right_service	7=set to seven data bits; 8=set to eight data bits

CONF_SERIAL_PORT_STBITS

Tag code	NumDes	Message	SNMP Support
0x0280	physical port	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	1=modemport stopbits are set to 1; 2=modemport stopbits are set to 2
Write	t_octet	access_right_service	1=modemport stopbits are set to 1; 2=modemport stopbits are set to 2

CONF_SERIAL_PORT_PAR

Tag code	NumDes	Message	SNMP Support
0x0281	physical port	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	0=no parity; 1=even parity; 2=odd parity
Write	t_octet	access_right_service	0=set to no parity; 1=set to even parity; 2=set to odd parity

CONF_SERIAL_PORT_MODE_VAL

Tag code	NumDes	Message	SNMP Support
0x0208	physical port	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	1=port mode is set to RS232; 2=port mode is set to RS422/RS485 (NOT avalibale in conventional VideoJet)
Write	t_octet	access_right_service	1=set port mode to RS232; 2=set port mode to RS422/RS485

CONF_SERIAL_PORT_HD_MODE_VAL

Tag code	NumDes	Message	SNMP Support
0x020b	yes	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	=0: halfduplex mode is set to off; =1:halfduplex mode is set to on; =2: halfduplex mode is set to on and buffered data (NOT avalibale in conventional VideoJet)
Write	t_octet	access_right_service	=0: set halfduplex mode to off; =1:set halfduplex mode to on; =2: set halfduplex mode to on and buffered data

CONF_SERIAL_PORT_HANDSHAKE

Tag code		NumDes	Message	SNMP Support
0x09a9		yes	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	get type of handshake (internal use only)	
Write	t_octet	access_right_service	set type of handshake (internal use only)	

CONF_SERIAL_ACTS_ACCESS_RIGHTS

Tag code		NumDes	Message	SNMP Support
0x0b1a		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	returns access rights of ACTS/OSRD commands which are sent via transparent data. 0: user rights (mainly PTZ) (default), 1: service rights (change settings)	
Write	t_octet	access_right_service	set access rights of ACTS/OSRD commands which are sent via transparent data. 0: user rights (mainly PTZ) (default), 1: service rights (change settings)	

CONF_BICOM_COMMAND

Tag code	NumDes	Message	SNMP Support
0x09a5	no	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported
Write	p_octet	access_right_user	Sends a BICOM read or write command to the local camera frontend, see detailed description . Notice: for some BICOM commands an access level higher than 'l_user' is needed. For details about this see Appendix 'Bicom Command Access Levels' of this document.

Bicom message over RCP command

Payload Structure

Without Lease Time

8	24	40	48
Flags 1 Byte	Bicom Server ID 2 Byte	Object ID 2 Byte	Operation 1 Byte
Bicom Payload n Bytes			

With Lease Time

8		24		56	
Flags 1 Byte	Lease time 2 Bytes	Lease time id 4 Bytes			
Bicom Server ID 2 Byte	Object ID 2 Byte		Operation 1 Byte	Bicom Payload n Bytes	

Flags

Transmission-Flags

Values:

Return_Payload (Must be set to 1 if return payload is expected)	Bit 0
Best_Effort (Set to 1 to transmitt as best effort frame)	Bit 1
Native_Errors (Set to 1 to receive the native BICOM errors)	Bit 2
Lease_Time_Available (Set to 1 if a lease time is included in the request)	Bit 3
unused set to 0	Bit 4
unused set to 0	Bit 5
unused set to 0	Bit 6
Flags_Available (Must be always set to 1)	Bit 7

Lease time

Time period in seconds the access should be blocked for other clients.
NOTE: this field has to be signaled in little endian mode.

Lease time id

Random number generated by the client. If a lease time > 0 is provided with the first access, further accesses during the lease time are only possible if the same lease time id is provided.

Bicom Server ID

Server ID, e.g. 0x0002 for "Device Server" (See BICOM application documentation)

Object ID

Object ID, e.g. 0x0100 for "Type" (See BICOM application documentation)

Operation

See BICOM application documentation

Values:

GET	0x01
-----	------

SET	0x02
SET_GET	0x03
INC	0x04
INC_GET	0x05
DEC	0x06
DEC_GET	0x07
SET_DFLT	0x08
SET_GET_DFLT	0x09

Bicom Payload

Bicom Payload

Example

RCP Request

81	Return payload expected
00 02	Server ID = 2 ("Device server")
01 50	Object "IdString"
01	Operation GET

RCP Reply

81	Return payload expected
00 02	Server ID = 2 ("Device server")
01 50	Object "IdString"
01	Operation GET
00 68 00 68 00 68 00 68 00 20 00 20 00 20 00 20	34 Bytes
00 20 00 20 00 20 00 20 00 20 00 20 00 20 00 20	Unicode ID
00 20	String

Bicom event over RCP message

Payload Structure

16	32	40
Bicom Server ID 2 Byte	Object ID 2 Byte	Operation 1 Byte
Bicom Payload n Bytes		

Bicom Server ID

Server ID, e.g. 0x0004 for "Camera Server" (See BICOM application documentation)

Object ID

Object ID, e.g. 0x0190 for "Colour" (See BICOM application documentation)

Operation

See BICOM application documentation

<u>Values:</u>	
EVENT	0x70 - 0x7F

Bicom Payload

Bicom Payload

Example

RCP message

00 04	Server ID = 4 ("Camera server")
01 90	Object "Colour"
70	Operation EVENT
00 00	2 Byte unsigned short: Colour mode is "B/W"

CONF_BICOM_SRV_CONNECTED

Tag code		NumDes	Message	SNMP Support
0x0a19		no	yes	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	return true if the device is connected to the BICOM server (Camera)	
Write	%	access_right_user	%	

CONF_BICOM_SUBCOMPONENTS_LIST

Tag code		NumDes	Message	SNMP Support
0x0aa5		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Read List of FamilyIDs and Firmware Versions for Subcomponents of Gen4 (Future Dinion?)	
Write	p_octet	access_right_internal	Read List of FamilyIDs and Firmware Versions for Subcomponents of Gen4 (Future Dinion?)	

CONF_KBD_CONFIG_CAMERA

Tag code	NumDes	Message	SNMP Support
0x0a31	yes (camera number on keyboard)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read configuration of camera numbers on keyboard
Write	p_octet	access_right_service	configure camera numbers on keyboard; assign parameters to a number (given by num)

Payload Structure

Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read configuration of monitor numbers on keyboard
Write	p_octet	access_right_service	configure monitor numbers on keyboard; assign parameters to a number (given by num)

Payload Structure

URL

Decoder/Monitor URL

Line

Video output line

Coder

Relative coder number (relative to line)

URL Length

Length of the following url (actual limit is 80).

CONF_KBD_CONNECT_PARAMS

Tag code		NumDes	Message	SNMP Support
0x0a33		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read parameters for connections established via keyboard	
Write	p_octet	access_right_service	set parameters for connections established via keyboard	

Payload Structure

Flags (optional)

<u>Values:</u>	
Bit 0	Request audio TX (listen at decoder side)
Bit 1	Request audio RX (speak at decoder side)

CONF_KBD_PASSWORD_CAMERA

Tag code		NumDes	Message	SNMP Support
0x0a34		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	get the password (scrambled) for all cameras used on keyboard	
Write	p_string	access_right_service	deposit a password for all cameras used on keyboard	

CONF_KBD_PASSWORD

Tag code		NumDes	Message	SNMP Support
0x0a69		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	get the password (scrambled) of the keyboard	
Write	p_string	access_right_service	deposit a password for the keyboard	

CONF_KBD_CONFIG_SALVO

Tag code	NumDes	Message	SNMP Support
0x0a3e	yes (salvo number)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read configuration of salvos for keyboard
Write	p_octet	access_right_service	configure salvos used for keyboard; assign parameters to a salvo number (given by num)

Payload Structure

Duration

Duration of one salvo position in seconds

Camera Num N

Camera number for salvo position N
(note: Camera number has to be specified using CONF_KBD_CONFIG_CAMERA)

CONF_KBD_KEY_LABEL

Tag code		NumDes	Message	SNMP Support
0x0a44		yes (key number; must be >0)	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read a label of a key used for the alarm task editor. The label is shown on the keyboard display.	
Write	p_string	access_right_service	deposit a label for a key used for the alarm task editor. The label is shown on the keyboard display.	

CONF_KBD_SET_ALARM

Tag code		NumDes	Message	SNMP Support
0x0a68		no	no	no
Datatype		Access Level	Description	
Read	-	access_right_minimal	not supported	
Write	f_flag	access_right_minimal	send alarm to keyboard	

CONF_TPPP_PORT

Tag code		NumDes	Message	SNMP Support
0x0ca8		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	gets the port of the third party protocol proxy (0: off)	
Write	t_word	access_right_service	sets the port of the third party protocol proxy (0: off)	

CONF_MAC_ADDRESS

Tag code	NumDes	Message	SNMP Support
0x00bc	yes	no	yes
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read out the systems MAC address numdes=1 EthernetMAC, numdes=2 WlanMAC, numdes=3 BluetoothMAC
Write	void	access_right_minimal	not supported

CONF_IP

Tag code	NumDes	Message	SNMP Support
0x0001	0,1 primary ip, 2 auto ip	no	yes
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the unit's IP address
Write	t_dword	access_right_service	set the unit's IP address

CONF_IP_STR

Tag code	NumDes	Message	SNMP Support
0x007c	0,1 primary ip, 2 auto ip	no	yes
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the unit's IP address using string notation (xxx.xxx.xxx.xxx)
Write	p_string	access_right_service	set unit's IP address using string notation (xxx.xxx.xxx.xxx)

CONF_SUBNET

Tag code		NumDes	Message	SNMP Support
0x0002		0,1 primary ip subnet, 2 auto ip subnet	no	yes
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	read the unit's subnet	
Write	t_dword	access_right_service	set the unit's subnet	

CONF_SUBNET_STR

Tag code		NumDes	Message	SNMP Support
0x007d		0,1 primary ip subnet, 2 auto ip subnet	no	yes
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the subnet mask using string notation (xxx.xxx.xxx.xxx)	
Write	p_string	access_right_service	set subnet mask using string notation (xxx.xxx.xxx.xxx)	

CONF_GATEWAY_IP_V6_STRING

Tag code		NumDes	Message	SNMP Support
0x0b11		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	IPv6 Gateway IP string or domain name	
Write	p_string	access_right_service	IPv6 Gateway IP string or domain name	

CONF_IP_V6_PREFIX_LEN

Tag code		NumDes	Message	SNMP Support
0x0b05		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	get unit's IPv6 address prefix length (Manually assigned IP)	
Write	t_octet	access_right_service	get unit's IPv6 address prefix length (Manually assigned IP)	

CONF_IP_V6_STR

Tag code		NumDes	Message	SNMP Support
0x0b06		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	Manually assigned IPv6 String or domain name	
Write	p_string	access_right_service	Manually assigned IPv6 String or domain name	

CONF_STATELESS_IP_V6_PREFIX_LEN

Tag code		NumDes	Message	SNMP Support
0x0bc6		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	get unit's IPv6 address prefix length (Automatic assigned IP)	
Write	t_octet	access_right_service	get unit's IPv6 address prefix length (Automatic assigned IP)	

CONF_STATELESS_IP_V6_STR

Tag code		NumDes	Message	SNMP Support
0x0bc7		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	IPv6 String (Automatic assigned IP)	
Write	p_string	access_right_service	IPv6 String (Automatic assigned IP)	

CONF_GATEWAY_IP_STR

Tag code		NumDes	Message	SNMP Support
0x007f		no	no	yes
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the gateway IP using string notation (xxx.xxx.xxx.xxx)	
Write	p_string	access_right_service	set gateway IP using string notation (xxx.xxx.xxx.xxx)	

CONF_DNS_SERVER_IP

Tag code		NumDes	Message	SNMP Support
0x0a1f		yes	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get dns server ip/ipv6, num = 0 or 1 sets primary dns, num = 2 sets secondary dns	
Write	t_dword	access_right_service	set dns server ip/ipv6, num = 0 or 1 sets primary dns, num = 2 sets secondary dns	

CONF_DNS_SERVER_IP_STRING

Tag code		NumDes	Message	SNMP Support
0x0b49		yes	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	get dns server ip/ipv6, num = 0 or 1 sets primary dns, num = 2 sets secondary dns	
Write	p_string	access_right_service	set dns server ip/ipv6, num = 0 or 1 sets primary dns, num = 2 sets secondary dns	

CONF_APPLY_NETWORK_SETTINGS

Tag code		NumDes	Message	SNMP Support
0x0cbe		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_service	not supported	
Write	t_dword	access_right_service	apply the configured network settings at runtime	

CONF_ETH_LINK

Tag code		NumDes	Message	SNMP Support
0x092d		yes; num=0 is the mode of the external state on single ethernet port units or the internal link mode on multiple ethernet port units; num>=1 is the mode of the corresponding port on multiple ethernet port units (SFP Fiber port is always the last counted port). On module based units, only the master module is capable of setting the external port modes.	no	yes
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	(half duplex=HD, full duplex =FD) 0=auto, 1=10MbitHD, 2=10MbitFD, 3=100MbitHD, 4=100MbitFD	
Write	t_octet	access_right_service	(half duplex=HD, full duplex =FD) 0=auto, 1=10MbitHD, 2=10MbitFD, 3=100MbitHD, 4=100MbitFD, 5=1000MbitFD, 8=10GbitFD	

CONF_ETH_LINK_STATUS

Tag code		NumDes	Message	SNMP Support
0x0a24		yes; num=0 returns the status of the external state on single ethernet port units or the internal link state on multiple ethernet port units; num>=1 returns the state of the corresponding port on multiple ethenet port units (SFP Fiber port is always the last counted port). On module based units, only the master module is capable of returning the external states.	yes	yes
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	(half duplex=HD, full duplex =FD) 0=No link, 1=10MbitHD, 2=10MbitFD, 3=100MbitHD, 4=100MbitFD, 5=1000MbitFD, 7=Wlan; 8=10GbitFD	
Write	void	access_right_service	not suported	

CONF_ETH_LINK_TROUGHPUT

Tag code		NumDes	Message	SNMP Support
0x0a80		Message : no	Description : lower 16 bit: downlink KBPS, upper 16 bit: uplink KBPS	no
Datatype		Access Level	Description	
Read	%	access_right_minimal	%	
Write	void	access_right_service	not suported	

CONF_ETH_TX_PKT_BURST

Tag code		NumDes	Message	SNMP Support
0x0afe		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	eth tx pkts per burst (0:=no limitation)	
Write	t_dword	access_right_service	eth tx pkts per burst (0:=no limitation)	

CONF_NBR_OF_EXT_ETH_PORTS

Tag code		NumDes	Message	SNMP Support
0x0a28		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of external ethernet ports of a device	
Write	void	access_right_service	not supported	

CONF_NBR_OF_EXT_ETH_COPPER_PORTS

Tag code		NumDes	Message	SNMP Support
0x0a29		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of external copper ethernet ports of a device	
Write	t_dword	access_right_service	returns the number of external copper ethernet ports of a device	

CONF_NBR_OF_EXT_ETH_FIBER_PORTS

Tag code		NumDes	Message	SNMP Support
0x0a2a		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the number of external fiber ethernet ports of a device	
Write	t_dword	access_right_service	returns the number of external fiber ethernet ports of a device	

CONF_LED_CAPS

Tag code		NumDes	Message	SNMP Support
0x0bf8		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	read power/traffic LED capabilities: 0=no capabilities, 1=disengageable	
Write	t_dword	access_right_service	not supported	

CONF_ENABLE_TRAFFIC_LED

Tag code		NumDes	Message	SNMP Support
0x09a6		no	no	yes
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	network activity LED (Dinion, NBC-255 camera): 0=off, 1=on	
Write	t_octet	access_right_service	Enables or disables the network activity LED (Dinion, NBC-255 camera)	

CONF_SND_MSS

Tag code		NumDes	Message	SNMP Support
0x0a02		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	max tcp send mss for all connections	
Write	t_dword	access_right_service	set the global tcp send mss; use this to reduce the max. send segment size for all tcp connections; higher settings than default will only be used by iSCSI connections (0 means default)	

CONF_EAP_IDENTITY

Tag code		NumDes	Message	SNMP Support
0x09ea		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the EAP identity	
Write	p_string	access_right_service	write the EAP identity	

CONF_EAP_GET_IDENTITY_LIST

Tag code	NumDes	Message	SNMP Support
0x0c4d	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_minimal	not supported

Payload Structure

16		32	
length	2 Byte	tag	2 Byte
value			
(length - header) Bytes ...			
length	2 Byte	tag	2 Byte
value			
(length - header) Bytes ...			
8		24	

length

length of tagged value including length and tag field

tag

tag specifying the encoding and meaning of the value

value

value payload data (length - header bytes), can contain tagged values

Generic description

This command returns the identities used for EAP authentication. If a EAP client certificate is assigned, the command returns up to 3 identity strings. All strings are UTF-16 coded. The order of the list is the order the EAP client uses the identities. If one identity fails to authenticate the next one from the list is used.

1. The alternative subject name from the certificate (tag 0x0001)

2. The common name from the certificate subject (tag 0x0002)

3. The EAP identity from config (tag 0x0003)

Each of these entries is optional and can be missing. The complete identity list is surrounded by the tag 0x0000.

If no identity is configured or found, the tag 0x0004 is returned to indicate the empty list.

Tag Structure

16		32	
length	2 Byte	tag = 0x8000 (List entry)	2 Byte
length	2 Byte	tag = 0x0001 (Subject Alt Name)	2 Byte
Alternative Subject Alt Name from certificate			
(length - header) Bytes ...			
length	2 Byte	tag = 0x0002 (Common Name)	2 Byte
Common Name from certificate			
(length - header) Bytes ...			
length	2 Byte	tag = 0x0003 (Configured identity)	2 Byte
The identity from the config			
(length - header) Bytes ...			
List entry may repeat			
If there are no identities the empty tag is returned. This is the only tag in the response then.			
length	2 Byte	tag = 0x0004 (No Identity)	2 Byte
No identity string found (nor in certificate, nor in config)			
0 Bytes ...			
8		24	

tag = 0x8000 (List entry)

The payload of tag list entry contains further tagged values described below.

For each identity list one list entry tag is contained in the command payload.

The highest bit (bit 15) is set to indicate that this tag will contain subtags.

tag = 0x0001 (Subject Alt Name)

Contains the Alternative Subject Name from the EAP client certificate coded as UTF-16, no zero termination.

tag = 0x0002 (Common Name)

Contains the subject's Common Name from the EAP client certificate coded as UTF-16, no zero termination.

tag = 0x0003 (Configured identity)

Contains the identity from the device config (given by the user) coded as UTF-16, no zero termination.

tag = 0x0004 (Empty list)

No identity strings were found.

CONF_EAP_ENABLE

Tag code		NumDes	Message	SNMP Support
0x09eb		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	read the EAP/802.1x status (0: off/don't do EAP/802.1x; 1: on/use EAP/802.1x)	
Write	t_octet	access_right_service	write the EAP/802.1x status (0: off/don't do EAP/802.1x; 1: on/use EAP/802.1x)	

CONF_EAP_PASSWORD

Tag code		NumDes	Message	SNMP Support
0x09ec		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the EAP password	
Write	p_string	access_right_service	write the EAP password	

CONF_SWITCH_TRUNKING

Tag code		NumDes	Message	SNMP Support
0x0a6b		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	external ports bitwise members of a trunk	
Write	t_octet	access_right_service	external ports bitwise members of a trunk	

CONF_SWITCH_LACP_ENABLE

Tag code		NumDes	Message	SNMP Support
0x0a6c		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	external ports bitwise enabling LACP+RSTP mode, 0: off, 1:on	
Write	t_octet	access_right_service	external ports bitwise enabling LACP+RSTP mode, 0: off, 1:on	

CONF_SWITCH_LACP_KEY

Tag code		NumDes	Message	SNMP Support
0x0a6d		yes	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	LACP Key for external ports	
Write	t_octet	access_right_service	LACP Key for external ports	

CONF_SWITCH_RSTP_PRIO

Tag code		NumDes	Message	SNMP Support
0x0a6e		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	RSTP Priority val in range of 0 ... 61440, must be multiple of 4096	
Write	t_dword	access_right_service	RSTP Priority val in range of 0 ... 61440, must be multiple of 4096	

CONF_SWITCH_RSTP_HELLO_TIME

Tag code		NumDes	Message	SNMP Support
0x0a6f		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	RSTP Hello Time in range of 1...10, default 2	
Write	t_octet	access_right_service	RSTP Hello Time in range of 1...10, default 2	

CONF_SWITCH_RSTP_MAX_AGE

Tag code		NumDes	Message	SNMP Support
0x0a70		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	RSTP Max Age in range of 6...40, default 20	
Write	t_octet	access_right_service	RSTP Max Age in range of 6...40, default 20	

CONF_SWITCH_RSTP_FWD_DELAY

Tag code		NumDes	Message	SNMP Support
0x0a71		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	RSTP Forward Delay in range of 4...30, default 15	
Write	t_octet	access_right_service	RSTP Forward Delay in range of 4...30, default 15	

CONF_SWITCH_RSTP_VERSION

Tag code		NumDes	Message	SNMP Support
0x0a72		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	RSTP Version, 0: STP compatible, 2: RSTP	
Write	t_octet	access_right_service	RSTP Version, 0: STP compatible, 2: RSTP	

CONF_SWITCH_RSTP_PORT_ENABLE

Tag code		NumDes	Message	SNMP Support
0x0a74		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	external ports bitwise enabling RSTP-only mode, 0: off, 1:on	
Write	t_octet	access_right_service	external ports bitwise enabling RSTP-only mode, 0: off, 1:on	

CONF_SWITCH_RSTP_PORT_EDGE

Tag code		NumDes	Message	SNMP Support
0x0a75		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	external ports bitwise determining if RSTP edge port	
Write	t_octet	access_right_service	external ports bitwise determining if RSTP edge port	

CONF_SWITCH_RSTP_PORT_PATHCOST

Tag code		NumDes	Message	SNMP Support
0x0a76		yes	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	RSTP pathcost of external ports in range of 1...200000000, while 0 means auto	
Write	t_dword	access_right_service	RSTP pathcost of external ports in range of 1...200000000, while 0 means auto	

CONF_BACKPLANE_TYPE

Tag code		NumDes	Message	SNMP Support
0x0a78		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	type of backplane 0xff: no backplane, 0xfe: old, 0: full-flavoured, 1: eco, 2: diplan	
Write	%	access_right_service	%	

CONF_BACKPLANE_FW_VERSION

Tag code		NumDes	Message	SNMP Support
0x0a84		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	firmware version on backplane 0: error / no (valid backplane, else: firmware revision)	
Write	%	access_right_service	%	

CONF_SWITCH_IGMP_IP

Tag code		NumDes	Message	SNMP Support
0x0a95		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	IP address that the VIPX1600 backplane uses as source IP in IGMP queries	
Write	t_dword	access_right_service	IP address that the VIPX1600 backplane uses as source IP in IGMP queries	

CONF_SWITCH_IGMP_SNOOPING_ENABLE

Tag code		NumDes	Message	SNMP Support
0x0a9a		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	state of IGMP snooping on Vitesse backplane switch	
Write	t_dword	access_right_service	enable/disable IGMP snooping on Vitesse backplane switch	

CONF_SWITCH_MAC_IS_SET

Tag code	NumDes	Message	SNMP Support
0x0a9d	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	determine of backplane has a valid MAC address: 0: invalid, 1: not yet known, ask later (during boot process), 2: valid
Write	%	access_right_service	%

CONF_REBOOT_SWITCH

Tag code	NumDes	Message	SNMP Support
0x0a9e	no	no	no
Datatype	Access Level	Description	
Read	%	access_right_service	%
Write	t_dword	access_right_service	reboot switch

CONF_WLAN_SSID

Tag code	NumDes	Message	SNMP Support
0x0943	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the WLAN ssid
Write	p_string	access_right_service	write the WLAN ssid

CONF_WLAN_WPA_PSK

Tag code	NumDes	Message	SNMP Support
0x0ac3	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_service	read the WPA pre shared key
Write	p_string	access_right_service	write the WPA pre shared key

CONF_WLAN_IOCTLL

Tag code	NumDes	Message	SNMP Support
0x0c4c	no	no	no
Datatype	Access Level	Description	
Read		access_right_minimal	not supported
Write	p_octet	access_right_service	Execute ioctl with wifi driver

CONF_PORT_FC_MODE

Tag code	NumDes	Message	SNMP Support
0x0abb	yes	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	num=0 is the flow control mode of the external state on single ethernet port units or the internal fc mode on multiple ethernet port units; num>=1 is the fc mode of the corresponding port on multiple ethernet port units (SFP Fiber port is always the last counted port). On module based units, only the master module is capable of setting the external port fc modes.
Write	t_octet	access_right_service	num=0 is the flow control mode of the external state on single ethernet port units or the internal fc mode on multiple ethernet port units; num>=1 is the fc mode of the corresponding port on multiple ethernet port units (SFP Fiber port is always the last counted port). On module based units, only the master module is capable of setting the external port fc modes.

CONF_WLAN_SCAN

Tag code	NumDes	Message	SNMP Support
0x0ac6	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	Performs a WLAN network scan, see detailed description
Write		access_right_service	not supported

Payload Structure

16	32
Number of Entries	
4 Bytes	

Sequence of:

SSID	
32 Bytes	
MAC Address	
6 Bytes	
	Strength
	4 Bytes
	Channel
	4 Bytes
	Flags
	4 Bytes
16	32

SSID

Name of Network.

MAC Address

MAC Address of AccessPoint.

Strength

Signal Strength [0;5]

Channel

Channel used by AccessPoint [0; 14]

Flags

Values:

Bit0	WEP encryption supported
Bit1	WPA encryption supported
Bit2	WPA2 encryption supported
Bit3	WPS supported

CONF_WLAN_LINK_TEST

Tag code	NumDes	Message	SNMP Support
0x0b23	no	no	no
Datatype	Access Level	Description	
Read	t_int	access_right_service	Test WLAN setup (try ability to associate to AP with current settings and return result 0=error, 1=success)
Write		access_right_service	not supported

CONF_WLAN_OPERATING_MODE

Tag code	NumDes	Message	SNMP Support
0x0ac7	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Gets the operating mode of WLAN (0="off", 1="auto (Station only)", 2="Access point")
Write	t_octet	access_right_service	Sets the operating mode of WLAN (0="off", 1="auto (Station only)", 2="Access point")

CONF_SWITCH_POST_UPDATE_ACTION

Tag code	NumDes	Message	SNMP Support
0x0ac5	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	id that indicates which action is to be executed as the switch firmware was updated (0: none)
Write	t_octet	access_right_service	id that indicates which action is to be executed as the switch firmware was updated (0: none)

CONF_WLAN_REGION_CODE

Tag code	NumDes	Message	SNMP Support
0x0acf	no	no	no
Datatype	Access Level	Description	
Read	t_word	access_right_minimal	Gets the region code for WLAN adapter (0x10="US", 0x20="CA", 0x30="EU", 0x31="SPN", 0x32="FR", 0x40="JPN", 0x41="JPN")
Write	t_word	access_right_service	Sets the region code for WLAN adapter (0x10="US", 0x20="CA", 0x30="EU", 0x31="SPN", 0x32="FR", 0x40="JPN", 0x41="JPN")

CONF_WLAN_LINK_QUALITY

Tag code	NumDes	Message	SNMP Support
0x0b1c	no	no	no
Datatype	Access Level	Description	
Read	t_int	access_right_minimal	read WLAN link signal level
Write		access_right_service	not supported

CONF_WLAN_WPS_SETUP

Tag code	NumDes	Message	SNMP Support
0x0bc4	Message : no	Description : Reports the camera WPS PIN to be entered in the access point.	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	p_string	access_right_service	<p>Starts a WiFi Protected Setup (WPS) session with the provided PIN (4 or 8 digits) and SSID.</p> <ul style="list-style-type: none">PIN: The string contains the pin, a plus sign and the SSID. E.g.: "12345678+MyAccessPoint"Push-button configuration (PBC): leave string emptyIf the SSID is omitted, the device scans for a suitable access point. <p>The status can be read via CONF_WLAN_WPS_STATUS.</p>

CONF_WLAN_WPS_STATUS

Tag code	NumDes	Message	SNMP Support
0x0bc5	no	yes	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	Read the WPA configuration status. The value is a combination of the status (bit 7 to 4) and the mode (bit 3 to 0): <ul style="list-style-type: none">bit 7..4:<ul style="list-style-type: none">0 = not started1 = ongoing2 = successful3 = rejected by the access point4 = timeout5 = invalid PINbit 3..0:<ul style="list-style-type: none">0 = none1 = PBC2 = PIN
			Write % access_right_service %

CONF_WLAN_DEFAULT_CHANNEL

Tag code	NumDes	Message	SNMP Support
0x0945	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	read the WLAN channel
Write	t_octet	access_right_service	write the WLAN channel

CONF_SOCKET_KNOCKER_MODE

Tag code	NumDes	Message	SNMP Support
0x0b5c	-	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get mode of the socket knocker: 0=off, 1=on, 2=auto
Write	t_dword	access_right_service	switch socket knocker on/off: 0=off, 1=on, 2=auto

CONF_SOCKET_KNOCKER_DESTINATION

Tag code		NumDes	Message	SNMP Support
0x0aee		destination number (starting with 1)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get socket knocker destination and connection configuration. See detailed description for payload structure	
Write	p_octet	access_right_service	specify socket knocker destination and connection configuration. See detailed description for payload structure	

Payload Structure

16		32	
port 2 Bytes	ssl 1 Byte	nbr of sockets 1 Byte	
reserved 4 Bytes			
url ...			

port

destination port

ssl

provide ssl socket: 0=no ssl, 1=ssl

nbr of sockets

number of idle sockets to distribute. As soon as a socket is used, a new one is provided.

reserved

reserved for future use. Set to zero.

url

destination url. Zero-terminated ascii string. Currently max. 128 characters (incl. zero termination).

CONF_SOCKET_KNOCKER_DESTINATION_NAME

Tag code		NumDes	Message	SNMP Support
0x0c83		destination number (starting with 1); see CONF_SOCKET_KNOCKER_DESTINATION	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	get the 'friendly name' for a socket knocker destination url (configured by CONF_SOCKET_KNOCKER_DESTINATION). Shown to the customer to identify any connected Cloud Service. Max. 64 characters.	
			set a 'friendly name' for a socket knocker destination url (configured by CONF_SOCKET_KNOCKER_DESTINATION). Shown to the customer to identify any connected Cloud Service. Max. 64 characters.	
Write	p_string	access_right_service		

CONF_SOCKET_KNOCKER_STATUS

Tag code	NumDes	Message	SNMP Support
0x0b98	destination number (starting with 1)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get the current status of the socket knocker. See detailed description for payload structure
Write	%	access_right_service	%

Payload Structure

16		32	
state 1 Byte	reason 1 Byte	reserved 1 Byte	reserved 1 Byte

state

current status of socket knocker

Values:

Not running	0
Trying to connect	1
Connected (ready for cloud service)	2

reason

reason for current state

Values:

As expected	0
Unknown	1
Auto mode: DHCP off or not successful	2
Auto mode: max knocking attempts reached	3
Auto mode: max knocking time reached	4
URL could not be resolved	5
Destination not responding	6

reserved

reserved for future use.

CONF_FTP_SERVER_PORT

Tag code		NumDes	Message	SNMP Support
0x0b9f		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the Port of the camera internal FTP server for loading files to the camera; Value 0 turns server off	
Write	t_word	access_right_service	set the Port of the camera internal FTP server for loading files to the camera; Value 0 turns server off	

CONF_FTP_PWD

Tag code		NumDes	Message	SNMP Support
0x0b1b		SessionId (see CONF_START_CLIENT): optional parameter to identify a already existing ftp client session	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	gets the working directory of the configured ftp server	
Write	p_string	access_right_service	not supported	

CONF_ACCOUNT_LIST

Tag code		NumDes	Message	SNMP Support
0x0b1d		SessionId (see CONF_START_CLIENT): optional parameter to identify a already existing ftp client session	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	returns the response from the ftp/dropbox LIST command	
Write	p_string	access_right_service	not supported	

CONF_ACCOUNTS_CREATE_FOLDER

Tag code	NumDes	Message	SNMP	Support
0x0b6c	SessionId (see CONF_START_CLIENT): optional parameter to identify a already existing client session	no		no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	not supported	
Write	p_octet	access_right_service	creates a new folder. Argument: folder name	

CONF_ACCOUNTS_DELETE_FOLDER

Tag code	NumDes	Message	SNMP	Support
0x0b6f	SessionId (see CONF_START_CLIENT): optional parameter to identify a already existing client session	no		no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	not supported	
Write	p_octet	access_right_service	deletes a folder. Argument: folder name	

CONF_FTP_CWD

Tag code	NumDes	Message	SNMP	Support
0x0b1e	SessionId: optional parameter to identify a already existing ftp client session	no		no
Datatype		Access Level	Description	
Read	p_string	access_right_service	changes the working directory	
Write	p_string	access_right_service	not supported	

CONF_FTP_CDUP

Tag code		NumDes	Message	SNMP Support
0x0b1f		SessionId: optional parameter to identify a already existing ftp client session	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	changes to parent directory	
Write	p_string	access_right_service	not supported	

CONF_START_CLIENT

Tag code		NumDes	Message	SNMP Support
0x0b20		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_service	starts a ftp client session, might be needed for commands like CONF_FTP_CDUP, CONF_FTP_CWD, CONF_FTP_LIST, CONF_FTP_PWD. This session stays alive for 5 min. It can be should be shut down using CONF_FTP_STOP_CLIENT. This command returns a 2 byte sessionId that can be used to reference the session	
Write	t_word	access_right_service	not supported	

CONF_STOP_CLIENT

Tag code		NumDes	Message	SNMP Support
0x0b21		SessionId	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_service	not supported	
Write	t_word	access_right_service	shut down the ftp session indified via the num parameter, might be needed for commands like CONF_FTP_CDUP, CONF_FTP_CWD, CONF_FTP_LIST, CONF_FTP_PWD	

CONF_FTP_FILE_NAME

Tag code		NumDes	Message	SNMP Support
0x0b35		response: 1st OCTET inst, 2nd OCTET mode (0->rec, 1->live),	request: 1st OCTET inst, 2nd OCTET mode (0->rec, 1->live), 64 OCTETs reserved	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	gets the user defined ftp file name for the first recording or live instance:	
Write	p_octet	access_right_service	sets the user defined ftp file name for the first recording or live instance:	

CONF_ACCOUNT_LOGIN_TEST

Tag code		NumDes	Message	SNMP Support
0x0b36		yes account info (1...4)	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_user	checks if a login to the specified ftp or dropbox server is possible. In case of dropbox this command is used for authentication. FTP: return value: 0: ok , 1: Connect failed, 2: invalid user or password, 3: set directory failed, 4: general error, 5: List failed; DROPBOX: 0- Authentication session started, CONF_DROPBOX_AUTHENTICATION_STATUS message informs about the status; other value: start Authentication failed	
Write	t_int	access_right_service	not supported	

CONF_DIFF_SERV_VAL

Tag code		NumDes	Message	SNMP Support
0x0b27		yes 1..6 Audio/Video/Control/Alarm-Audio/Alarm-Video/Alarm-Control	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	gets the DiffServ value for media sockets	
Write	t_octet	access_right_service	sets the DiffServ value for media sockets	

CONF_DIFF_SERV_POST_ALARM_TIME

Tag code		NumDes	Message	SNMP Support
0x0b3b		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get post alarm time (in seconds) for DiffServ alarm values	
Write	t_word	access_right_service	set post alarm time (in seconds) for DiffServ alarm values. (Only if DiffServ alarm values are specified and therefore DiffServ values are changed during an alarm).	

CONF_IPV4_FILTER

Tag code		NumDes	Message	SNMP Support
0x0b3c		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read the list of 2 allowed pairs of one IPv4 address and a corresponding IPv4 mask (addresses and masks in network byte order; filled completely with 0.0.0.0 entries, if disabled; in case only first entry is used, the second is filled with 0.0.0.0 / 0.0.0.0, order is address1, mask1, address2, mask2)	
Write	p_octet	access_right_service	write the list of 2 allowed pairs of one IPv4 address and a corresponding IPv4 mask (addresses and masks in network byte order; filled completely with 0.0.0.0 entries, if disabled; in case only first entry is used, the second is filled with 0.0.0.0 / 0.0.0.0, order is address1, mask1, address2, mask2)	

CONF_UPLINK_KBPS

Tag code		NumDes	Message	SNMP Support
0x0c03		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_service	uplink bandwidth of system in kbps	
Write	t_dword	access_right_service	uplink bandwidth of system in kbps	

CONF_TC_CLIENT_PARAMS

Tag code		NumDes	Message	SNMP Support
0x0c04		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_user	get client params: 4 bytes if client is local, 4 bytes kbps; session id is needed	
Write	p_octet	access_right_user	set client params: 4 bytes if client is local, 4 bytes kbps; session id is needed	

CONF_OBEY_ICMP_REDICRECTS

Tag code		NumDes	Message	SNMP Support
0x0c13		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_service	obey or ignore ICMP redirect messages, 0 = ignore, 1 = obey	
Write	t_octet	access_right_service	obey or ignore ICMP redirect messages, 0 = ignore, 1 = obey	

CONF_NETWORK_SERVICES

Tag code	NumDes	Message	SNMP Support
0x0c62	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns all running network services
Write	p_octet	access_right_service	returns all running network services

Payload Structure

The payload if this command is a tagged command structure. Each length field reprents the length of the field **including** the complete tag header (min length is 4 bytes).
If a tag contains subtags, this is indicated by bit 15 == 1 in tag number.

16		32	
length 2 Byte	tag 0x8000 (surrounding tag for each entry) 2 Byte		
length (always 0x0008) 2 Byte	tag (0x0001) 2 Byte		
Numerical ID of service 4byte (32bit)			
length (text + header) 2 Byte	tag (0x0002) 2 Byte		
Label string to display as default Num characters			
length (always 0x0008) 2 Byte	tag (0x0003) 2 Byte		
Enable (!= 0 enabled; == 0 disabled) 4 Byte (32bit)			
Following tag is optional. Only present if port is adjustable.			
length (always 0x0008) 2 Byte	tag (0x0004) 2 Byte		
TCP/UDP port number 4byte (32bit)			
Next entry indicated by a 0x8000 tag. . . .			
8		24	

Generic description

Reading the CONF_NETWORK_SERVICES command returns a list of TCP/UDP services which are available on the device. Each entry represents one service. The entry show if the service is enabled at the moment and what TCP/UDP port it is assigned to if a port is available. If the port cannot be adjusted the 0x0004 tag is simply missing. Client software can show this list to give the user the opportunity to check and configure all runiing network services.

Writing this command allows to configure the services returned by a preceding read. In write direction the command payload has the same structure. The client does not need to include all services returned by the read. It can only add the services to change to the write payload. The tag 0x0002 (label) must not be included in write payload. The service ID must provided and identifies the service to change. The ID is not fixed across firmware versions and must be retrieved by a preceeding read.

Writing this command is only a request to the device to shutdown or start the services. That's why the device cannot answer with with the new state of the services. The device replies to a write operation with the actual state of the network services (the complete list). This does eventually not reflect the changes which will be done by the requests in this write operation.

ATTENTION: Most network services need a reboot of the device to be stopped or started. After writing this command the device should be rebooted!

Tag definition

tag 0x8000 (List entry)

Surrounding tag for each entry in the list. With help of the length field client software is the change to skip complete entries.

tag 0x0001 (Numerical ID)

This tag gives each service a numerical ID. The ID should be retrieved via reading this command first. You can assume, that the ID for a special service keeps constant in newer firmware versions. So this ID can be treated as a unique identifier for a specific service. When using this command in write direction to configure a service this ID must be presented to identify the service.

tag 0x0002 (Label)

A printable label for this service. If the client does not know how to translate this label it can show this label as default. The label is **not** used to identify the service and can be omitted when writing this command.

tag 0x0003 (Enable)

A value != 0 indicates that this service is enbled and the port is open at UDP/TCP level.
A value == 0 indicates that the service is disabled.
In write direction you can use this bit to disable a service.

tag 0x0004 (UDP/TCP port)

This tag is only present if the UDP/TCP port is adjustable for this service. Else this tag is simply missing.

For historical reasons most services set their port to 0 to show that they are disabled. If you set the 'Enable' tag to 0 at write and set the port != 0 the command will automatically set the port to 0.

Setting 'Enabled' tag to != 0 and the port to 0 will use default port. Else the given port will be used.

CONF_CBS_COMMISSION

Tag code	NumDes	Message	SNMP Support
0x0c72	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_minimal	Commission to CBS-Account. Action, User, Password. See detailed description for payload structure

Payload Structure

16		32
action 1 Byte	user ...	
password ...		

action

- 0 = cancel commision
- 1 = start commission

user

user name (0-terminated, max-len 128)

password

user password (0-terminated, max-len 128)

CONF_CBS_STATUS

Tag code		NumDes	Message	SNMP Support
0x0c73		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Status of CBS Commission. see detailed Description ;	
Write	p_octet	access_right_minimal	update commission status, no parameters needed	

Payload Structure

		16	32
cbs status	cbs action status		
1 Byte	1 Byte		

cbs status

is a status byte for "Network->Advanced"

- 0 = Registered
- 1 = OnGoing
- 2 = UnRegistered
- 255 = Unknown

cbs action status

is a detailed status byte for "Remote Portal" dialog

- 0 = Ok
- 1 = OnGoing
- 2 = UnRegistered
- 3 = Canceled
- 0xe0 = ReconfigurationForbidden
- 0xe1 = ReconfigurationConflict
- 0xe2 = crsaReconfigurationUnprocessableEntity
- 0xe3 = crsaReconfigurationLocked
- 0xe4 = crsaReconfigurationServiceUnavailibale
- 0xe5 = crsaReconfigurationAuthError
- 0xf9 = crsaDeviceSecretError
- 0xfa = crsaReceiveError
- 0xfb = crsaMessageError
- 0xfc = crsaInvalidMacAddressFormat
- 0xfd = crsaFriendlyNameEmpty
- 0xfe = crsaCloudUnreachable
- 0xff = crsaUnexpectedError

CONF_CBS_DESTINATION

Tag code	NumDes	Message	SNMP Support
0x0c75	destination number (starting with 1)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get CBS destination and connection configuration. See detailed description for payload structure
Write	p_octet	access_right_service	set CBS destination and connection configuration. See detailed description for payload structure

Payload Structure

16		32	
port 2 Bytes	ssl 1 Byte	reserved1 1 Byte	
reserved2 4 Bytes			
uri ...			

port

destination port

ssl

provide ssl socket: 0=no ssl, 1=ssl

reserved1

reserved for future use. Set to zero.

reserved2

reserved for future use. Set to zero.

url

destination url. Zero-terminated ascii string. Currently max. 128 characters (incl. zero termination).

example payload for port 443, ssl 1, url "api.remote.boschsecurity.com"

0x01bb0100000000006170692e72656d6f74652e626f73636873656375726974792e636f6d00

example payload for port 443, ssl 1, url "api.remotest.cbs.boschsecurity.com"

0x01bb0100000000006170692e72656d6f746573742e6362732e626f73636873656375726974792e636f6d00

CONF_MULTICAST_VIDEO_GROUP_IP_STR

Tag code	NumDes	Message	SNMP Support
0x01b4	abs video coder instance	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the multicast video group address
Write	p_string	access_right_service	set the multicast video group address (range: 224.0.0.10 .. 239.255.255.255)

CONF_MULTICAST_VIDEO_GROUP_IP

Tag code	NumDes	Message	SNMP Support
0x01b1	abs video coder instance	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the multicast video group address
Write	t_dword	access_right_service	set the multicast video group address (range: 224.1.0.0 .. 239.255.255.255)

CONF_MULTICAST_AUDIO_GROUP_IP_STR

Tag code	NumDes	Message	SNMP Support
0x0cd2	abs audio coder instance	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the multicast audio group address
Write	p_string	access_right_service	set the multicast audio group address (range: 224.0.0.10 .. 239.255.255.255)

CONF_MULTICAST_AUDIO_GROUP_IP

Tag code	NumDes	Message	SNMP Support
0x0cd1	abs audio coder instance	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the multicast audio group address
Write	t_dword	access_right_service	set the multicast audio group address (range: 224.1.0.0 .. 239.255.255.255)

CONF_MULTICAST_VIDEO_PORT_STR

Tag code	NumDes	Message	SNMP Support
0x0288	coder instance	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the multicast video UDP port number
Write	p_string	access_right_service	set the multicast video UDP port (even port numbers only)

CONF_MULTICAST_VIDEO_PORT

Tag code	NumDes	Message	SNMP Support
0x0286	coder instance	no	no
Datatype	Access Level	Description	
Read	t_word	access_right_minimal	read the multicast video UDP port number
Write	t_word	access_right_service	set the multicast video UDP port (even port numbers only)

CONF_MULTICAST_AUDIO_PORT_STR

	Tag code	NumDes	Message	SNMP Support
	0x01b5	coder instance	no	no
	Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read the g711 multicast UDP port number	
Write	p_string	access_right_service	set the multicast audio G711 UDP port (even port numbers only)	

CONF_MULTICAST_AUDIO_PORT

	Tag code	NumDes	Message	SNMP Support
	0x01b2	coder instance	no	no
	Datatype	Access Level	Description	
Read	t_word	access_right_minimal	read the g711 multicast UDP port number	
Write	t_word	access_right_service	set the multicast audio G711 UDP port (even port numbers only)	

CONF_MULTICAST_TTL

	Tag code	NumDes	Message	SNMP Support
	0x0267	no	no	no
	Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	get the TTL (time to live) in IP-Header for multicast packets	
Write	t_octet	access_right_service	set the TTL (time to live) in IP-Header for multicast packets	

CONF_IGMP_VERSION

Tag code	NumDes	Message	SNMP Support
0x09e5	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	read the igmp(internet group management protocol) version (0: Automatic from network; 1: Version1; 2: Version2; 3: Version3)
Write	t_octet	access_right_service	Set the igmp version (0: Automatic from network; 1: Version1; 2: Version2; 3: Version3).

CONF_STREAMING_VAL

Tag code	NumDes	Message	SNMP Support
0x01b9	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	=0: set multicast streaming mode to off; =1: set multicast streaming mode mpeg4 to on; =2: set multicast streaming mode mpeg2 to on; =3: set multicast streaming mode mpeg4+mpeg2 to on
Write	t_octet	access_right_service	=0: set multicast streaming mode to off; =1: set multicast streaming mode mpeg4 to on; =2: set multicast streaming mode mpeg2 to on; =3: set multicast streaming mode mpeg4+mpeg2 to on

CONF_VIDEO_ENC_STREAMING

Tag code	NumDes	Message	SNMP Support
0x099a	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	video streaming on coder (video encoder n: coderbits=1<<(n-1))
Write	t_dword	access_right_service	enable video streaming on coder. (video encoder n: coderbits=1<<(n-1))

CONF_AUDIO_ENC_STREAMING

Tag code		NumDes	Message	SNMP Support
0x099b		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	audio streaming on coder (audio encoder n: coderbits=1<(n-1))	
Write	t_dword	access_right_service	enable audio streaming on coder (audio encoder n: coderbits=1<(n-1))	

CONF_START_MULTICAST_STREAMING

Tag code		NumDes	Message	SNMP Support
0x0b8b		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	video streaming on coder (1st coder-> 1st octet, 2nd coder-> 2nd octet....)	
Write	p_octet	access_right_service	enable video streaming on coder. 1st Coder->1 octet, 2nd Coder ->2nd octet....	

CONF_AUDIO_STREAMING_ENCODING

Tag code		NumDes	Message	SNMP Support
0x0b8d		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	defines the audio encoding that is used for streaming (1: g711, 2: aac)	
Write	t_dword	access_right_service	defines the audio encoding that is used for streaming (1: g711, 2: aac)	

CONF_JOIN_STREAM_NOW

Tag code	NumDes	Message	SNMP Support
0x01d4	no	no	no
Datatype	Access Level	Description	
Read	void	access_right_minimal	not supported
Write	flag	access_right_live	start joining a multicast stream from the alarm IP

CONF_DYNDNS_SERVER

Tag code	NumDes	Message	SNMP Support
0x030f	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	obsolete - IP address of VCS dynamic DNS server
Write	t_dword	access_right_service	obsolete - IP address of VCS dynamic DNS server

CONF_DYNDNS_TIMEOUT

Tag code	NumDes	Message	SNMP Support
0x0310	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	obsolete - time in sec when the VJ should retrigger its VCS dynamic server registration (30 .. 86400)
Write	t_dword	access_right_service	obsolete - time in sec when the VJ should retrigger its VCS dynamic server registration (30 .. 86400)

CONF_DYNDNS_SERVER_REPLY

Tag code		NumDes	Message	SNMP Support
0x0311		no	yes	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	not supported; will generate message when server answers	
Write	p_string	access_right_service	not supported; will generate message when server answers	

CONF_DYNDNS_HOST_NAME

Tag code		NumDes	Message	SNMP Support
0x0a56		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the dyndns host name that is to be registered at dyndns.com	
Write	p_string	access_right_service	write the dyndns host name that is to be registered at dyndns.com	

CONF_DYNDNS_USER_NAME

Tag code		NumDes	Message	SNMP Support
0x0a57		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the user name of account at dyndns.com	
Write	p_string	access_right_service	write the user name of account at dyndns.com	

CONF_DYNDNS_PASSWORD

Tag code		NumDes	Message	SNMP Support
0x0a58		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	read the password of account at dyndns.com	
Write	p_string	access_right_service	write the password of account at dyndns.com	

CONF_DYNDNS_ENABLE

Tag code		NumDes	Message	SNMP Support
0x0a59		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	1: enable, 0: disable registering at dyndns.com	
Write	t_octet	access_right_service	enable/disable registering at dyndns.com	

CONF_DYNDNS_STATE

Tag	code	NumDes	Message	SNMP Support
	0x0a5a	no	yes	no
	Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	state of registering at dyndns.com, see detailed description	
Write	%	access_right_service	%	

Payload Structure

State
1 Byte

8

State

the current state of the process of registering the device at dyndns.com

Values:

successfully updated	0
updated with unchanged cfg	1
dyndns username or password wrong	2
not fully qualified domain name (e.g. not in form host.dyndns.org)	3
wrong host name for this dyndns user account	4
too many hosts in last update	5
host name is blocked by dyndns for update abuse	6
no user agent submitted or http method not permitted	7
dyndns server error dns related	8
dyndns server error maintenance related	9
update not done due to misconfiguration	252
fatal error during update process	253
update in process	254
switched off	255

CONF_DYNDNS_LAST_REGISTER

Tag code	NumDes	Message	SNMP Support
0x0a5b	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	data of last successful registration at dyndns.com, 8 bytes, first DWORD: register time in secs since 2000, second DWORD: last registered IP
Write	p_octet	access_right_service	data of last successful registration at dyndns.com, 8 bytes, first DWORD: register time in secs since 2000, second DWORD: last registered IP

CONF_DYNDNS_FORCE_REGISTER_NOW

Tag code	NumDes	Message	SNMP Support
0x0a5c	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	writing forces registering at dyndns.com / reading checks if forcing is allowed (has not been done since bootup)
Write	t_octet	access_right_service	writing forces registering at dyndns.com / reading checks if forcing is allowed (has not been done since bootup)

CONF_DYNDNS_PROVIDER

Tag code	NumDes	Message	SNMP Support
0x0b67	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	read selected dyndns provider (0: dyndns.org, 1: no-ip.com, 2: selfhost.de)
Write	t_octet	access_right_service	write selected dyndns provider (0: dyndns.org, 1: no-ip.com, 2: selfhost.de)

CONF_DYNDNS_STATUS_MAIL_ONOFF

Tag code	NumDes	Message	SNMP Support
0x0b71	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	read enable or disable state for sending status update emails on Dyndns status change (0: off (default), 1: on)
Write	t_octet	access_right_service	enable or disable sending status update emails on Dyndns status change (0: off (default), 1: on)

CONF_DYNDNS_MAIL_SMTP_SRV_IP_STR

Tag code	NumDes	Message	SNMP Support
0x0b72	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read address of SMTP server to be used for for Dyndns status mail transmission
Write	p_string	access_right_service	set address of SMTP server to be used for for Dyndns status mail transmission

CONF_DYNDNS_MAIL_SMTP_LOGIN

Tag code	NumDes	Message	SNMP Support
0x0b73	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	read login for SMTP server to be used for for Dyndns status mail transmission
Write	p_string	access_right_service	set login for SMTP server to be used for for Dyndns status mail transmission

CONF_DYNDNS_MAIL_SMTP_PASS

Tag code		NumDes	Message	SNMP Support
0x0b74		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	read password for SMTP server to be used for for Dyn dns status mail transmission	
Write	p_string	access_right_service	set password for SMTP server to be used for for Dyn dns status mail transmission	

CONF_DYNDNS_MAIL_DEST_EMAIL_ADDR

Tag code		NumDes	Message	SNMP Support
0x0b75		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read destination email address to be used for for Dyn dns status mail transmission	
Write	p_string	access_right_service	set destination email address to be used for for Dyn dns status mail transmission	

CONF_DYNDNS_MAIL_SENDER_NAME

Tag code		NumDes	Message	SNMP Support
0x0b76		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read senders name to be used for for Dyn dns status mail transmission	
Write	p_string	access_right_service	set senders name to be used for for Dyn dns status mail transmission	

CONF_DYNDNS_MAIL_TEST_SEND

Tag code	NumDes	Message	SNMP Support
0x0b77	no	no	no
Datatype	Access Level	Description	
Read	%	access_right_minimal	%
Write	t_octet	access_right_service	send test mail with current Dyn dns status to configured destination

CONF_AUTODETECT_REPLY_GROUP

Tag code	NumDes	Message	SNMP Support
0x0956	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get the multicast group to which (when set) the VJ will listen for multicast autodetect requests
Write	t_dword	access_right_service	set the multicast group to which (when set) the VJ will listen for multicast autodetect requests on port 1800; when set to an invalid multicast address, the default address of 225.86.67.83 is used

CONF_UNSOLICITED_AUTODETECT_REPLY_TIME

Tag code	NumDes	Message	SNMP Support
0x0957	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get the time in seconds, when the VJ shall send out unsolicited autodetect reply to the RCP port(off when set to 0)
Write	t_dword	access_right_service	set the time in seconds, when the VJ shall send out unsolicited autodetect reply to port 1800 (off when set to 0); uses broadcast, and multicast if AUTODETECT_REPLY_GROUP is set

CONF_DISCOVER_PORT

Tag code		NumDes	Message	SNMP Support
0x0976		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the discover port	
Write	t_word	access_right_service	set the discover port	

CONF_LOCAL_HTTP_PORT

Tag code		NumDes	Message	SNMP Support
0x0954		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the local HTTP port for browser access	
Write	t_word	access_right_service	set the local HTTP port for browser access (NOTE: it is not allowed to turn off both, HTTP and HTTPS, at the same time)	

CONF_LOCAL_HTTPS_PORT

Tag code		NumDes	Message	SNMP Support
0x0a0e		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the local HTTPS port for browser access	
Write	t_word	access_right_service	set the local HTTPS port for browser access (NOTE: it is not allowed to turn off both, HTTP and HTTPS, at the same time)	

CONF_RCP_SERVER_PORT

Tag code		NumDes	Message	SNMP Support
0x0a17		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the local RCP server TCP port number	
Write	t_word	access_right_service	set the local RCP server TCP port number, allowed: 0 or 1756 (Reboot necessary)	

CONF_TELNET_PORT

Tag code		NumDes	Message	SNMP Support
0x0a18		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	get the local Telnet TCP port number	
Write	t_word	access_right_service	set the local Telnet TCP port number	

CONF_RTSP_PORT

Tag code		NumDes	Message	SNMP Support
0x0a63		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	reads the LocalRtspPort	
Write	t_dword	access_right_service	sets the local Rtsp port (0: Rtsp off)	

CONF_ENABLE_UPNP

Tag code		NumDes	Message	SNMP Support
0x0ade		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	0: Upnp disabled; 1: Upnp enabled	
Write	f_flag	access_right_service	0: Upnp disabled; 1: Upnp enabled	

CONF_ENABLE_ONVIF

Tag code		NumDes	Message	SNMP Support
0x0bbd		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	0: Onvif disabled; 1: Onvif enabled (default value)	
Write	f_flag	access_right_service	0: Onvif disabled; 1: Onvif enabled (default value)	

CONF_GET_RTSP_SESSION_ID

Tag code		NumDes	Message	SNMP Support
0x0ae8		random value from (Rtsp Session setup)	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_live	gets the rcp session id of the rtsp session (identified by the random value)	
Write	t_dword	access_right_service	not supported	

CONF_HSTS_ENABLED

Tag code	NumDes	Message	SNMP Support
0x0c07	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	read the HSTS state (0=OFF, 1=ON 2=on + Http port redirect to HTTPS when HTTP port is also set to 0
Write	t_dword	access_right_service	set HSTS state (0=OFF, 1=ON 2=on + Http port redirect to HTTPS when HTTP port is also set to 0

CONF_ALLOW_BASIC_HTTP_AUTH_ON_NON_SSL SOCK

Tag code	NumDes	Message	SNMP Support
0x0cd8	no	no	no
Datatype	Access Level	Description	
Read	f_flag	access_right_minimal	allow basic http authentication on non SSL sockets, 0: not allowed (default), 1: allowed
Write	f_flag	access_right_service	allow basic http authentication on non SSL sockets, 0: not allowed (default), 1: allowed

CONF_PROTECT_HTTP_COOKIE

Tag code	NumDes	Message	SNMP Support
0x0cdc	no	no	no
Datatype	Access Level	Description	
Read	f_flag	access_right_minimal	0 = Don't protect default session cookie with HttpOnly (legacy behaviour), 1 = Mark default session cookie with HttpOnly flag
Write	f_flag	access_right_service	0 = Don't protect default session cookie with HttpOnly (legacy behaviour), 1 = Mark default session cookie with HttpOnly flag

CONF_TCP_FWD

Tag code	NumDes	Message	SNMP Support
0x0b2f	yes (Forwarder index 1...max, max=4: devices, max=32: generic)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	reads the Settings of the tcp forwarder per device (WORD http listener port, WORD http forwarder port, WORD https listener port, WORD https forwarder port, string: ip)
Write	p_octet	access_right_service	writes the Settings of the tcp forwarder per device (WORD http listener port, WORD http forwarder port, WORD https listener port, WORD https forwarder port, string: ip)

CONF_PREPARE_FOR_RECORDING

Tag code	NumDes	Message	SNMP Support
0x0b51	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported, see detailed description
Write	p_octet	access_right_service	see detailed description

Payload Structure

rmt dev idx 16 Bits		rec idx 16 Bits	
flags 8 Bits	storage/lun cnt 8 Bits	strg/lun idx 1 8 Bits	N x 8 Bits
strg/lun idx N 8 Bits			

rmt dev idx

index of a remote device entry configured by CONF_ADD_REMOTE_DEVICE from 1 to n. Value 0 means the local device.

rec idx

recording index

<u>Values:</u>	
primary recording	1
secondary recording	2

flags

command specific flags

<u>Values:</u>	
remote managed storage	0x01

storage/lun cnt

number of following index enties for storages/luns (max. 8)

strg/lun idx 1 - N

this is the index of an as managed configured storage or the lun index of local storage of the remote device. (1 - n, n = storage/lun cnt)

CONF_PREPARE_FOR_RECORDING

This command is used to prepare a remote device for recording via a another device (e.g remote recording on a transcoder). Normally the remote device will be configured to record on one or more (upto 8) local managed storage, which is already configured by the command CONF_STORAGE_LIST. The Storage can be a local storage on the remote device or any storage on the local device. This is choosen by the flag "remote managed storage". If this flag is set, the storage/lun idx refers the lun index of a local storage on the remote device. Otherwise it is the index from the storage list of the local device. The preparation will be the configuration of the micro vrm on the recording device and in case of remote recording constellation, it will allow the remote recording on the storage managing device.

specific errors

0x01	no local storage configured
0x02	remote dev config error
0x03	local dev config error
0x04	remote dev offline
0x05	common errors
0x06	remote dev vrm managed
0x07	iscsi auth config error

CONF_ADD_REMOTE_DEVICE

Tag code		NumDes	Message	SNMP Support
0x0b52		entry index(1...4)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_live	read entry of remote devices, see detailed description	
Write	p_octet	access_right_service	add entry of remote devices, see detailed description	

Payload Structure

mac ...	
mac 6 bytes	reserved 2 bytes
line cnt 16 Bits	max coder per line 16 Bits
nbr of port entries 32 Bits	
forwarder entry 1 4 Bytes	
.	
.	
.	
forwarder entry N 4 Bytes	
url len 16 Bits	url ...
url (url len) bytes ...	
pwd len 16 Bits	pwd ...
pwd (pwd len) bytes ...	
device name len 16 Bits	device name ...
device name (device name len) bytes ...	

mac

mac of the device (will be stored only as information in config)

line cnt

max lines of the device (will be stored only as information in config)

max coder per line

max number of coder instances per line (will be stored only as information in config)

nbr of port entries

number of forward port entries following this field (actual limited to 2)

forwarder entry 1 - N

forwarder port entry (see payload description)

url len

length of the following url (actual limit is 64)

url

url for the connection to the remote device, ascii string including zero termination

pwd len

length of the following password (actual limit is 64)

pwd

password for the connection, ascii string including zero termination

device name len

length of the following device name (actual limit is 64)

device name

device name of the remote device, ascii string including zero termination

forwarder entry

remote port

port of the remote device

forwarder port

local port which forwards all data to the remote port

ADD_REMOTE_DEVICE

Adds a device with forwarder ports, all data to/from the forwarder ports will be forwarded to/from the configured device port. It is allowed to store complete zeroed forwarder/remote port entries. For entries which are referenced by CONF_RCP_CONNECT_SALVO command num param, it is necessary, that the first forward port entry contains the http port and the second one the https port. If one of these ports shall not be used, at least a zeroed entry (remote/forwarder port to zero) has to be placed. The max lines and coder per lines are just information, which will be stored together in the config. To delete an entry, send an empty or zeroed payload.

CONF_UPNP_SEARCH_IP_CONN_SERVICE

Tag code		NumDes	Message	SNMP Support
0x0b59		if set to 0xFFFF a extended payload is returned)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	searches for devices that support the upnp WANIPConnection service. Returns a list of devices entries (64 bytes addr, 64 bytes name, opt. 64 byte unique id (if extended payload is requested))	
Write	p_octet	access_right_service	not supported	

CONF_UPNP_TCP_FWD

Tag code		NumDes	Message	SNMP Support
0x0b5a		index of the remote device (1...4)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	not supported	
Write	p_octet	access_right_service	configures port forwarding in a upnp device that support the WANIPConnection:1 service. Input 64 bytes: address of the WANIPConnection:1 service in the router (returned by CONF_UPNP_SEARCH_IP_CONN_SERVICE).	

CONF_DHCP_VAL

Tag code		NumDes	Message	SNMP Support
0x00af		no	no	yes
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	read the DHCP state (0=OFF, 1=ON, 3=ON+APIPA-Fallback);	
Write	t_octet	access_right_service	set DHCP ip configuration value (0=OFF, 1=ON, 2=ON, but do not kick mechanism now, 3=ON+APIPA-Fallback)	

CONF_DHCP_ON

Tag code		NumDes	Message	SNMP Support
0x00ad		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	read the DHCP ON state	
Write	f_flag	access_right_service	enable DHCP ip configuration	

CONF_DHCP_OFF

Tag code		NumDes	Message	SNMP Support
0x00ae		no	no	no
Datatype		Access Level	Description	
Read	f_flag	access_right_minimal	read the DHCP OFF state	
Write	f_flag	access_right_service	disable DHCP ip configuration	

CONF_DHCP_STABLE

Tag code		NumDes	Message	SNMP Support
0x0ac8		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	read whether DHCP machine is in possession of an IP	
Write	%	access_right_service	%	

CONF_DHCP_COMPLIANCY

Tag code		NumDes	Message	SNMP Support
0x0ada		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	mode of dhcp operation, 0: use of last-assigned ip during non-available dhcp server allowed; 1: no fallback ips used, more compliant to rfc 2131	
Write	t_octet	access_right_service	mode of dhcp operation, 0: use of last-assigned ip during non-available dhcp server allowed; 1: no fallback ips used, more compliant to rfc 2131	

CONF_SNMP_SRV_PORT

Tag code		NumDes	Message	SNMP Support
0x0a25		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	Read the snmp server port	
Write	t_word	access_right_service	Set the snmp server port (reset nescessary)	

CONF_SNMP_TRAPS_HOST

Tag code	NumDes	Message	SNMP Support
0x00b6	yes	no	yes
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	not supported
Write	t_dword	access_right_service	not documented

CONF_SNMP_TRAPS_HOST_STR

Tag code	NumDes	Message	SNMP Support
0x00b7	yes	no	yes
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	not documented
Write	p_string	access_right_service	not documented

CONF_NBR_OF_TRAPS_HOSTS

Tag code	NumDes	Message	SNMP Support
0x029d	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	Number of hosts snmp traps can be sent to
Write	t_dword	access_right_service	read only

CONF_SNMP_TRAP_LIST

Tag code	NumDes	Message	SNMP Support
0x0a11	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	List of commands to be posted as snmp trap. See detailed description.
Write	p_octet	access_right_service	List of commands to be posted as snmp trap. see detailed description

Payload Structure

Trap Descriptor 1 - N

Sequence of:

RCP Msg Code

The code of the RCP message that is to be forwarded as SNMP trap.

Bitmask of Flags

Values:

SNMP_TRAP_ENABLED1

CONF_PMPP_PORT

Tag code		NumDes	Message	SNMP Support
0x0aba		no	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	gets the Pmpp Port of the Pmpp server(0: off)	
Write	t_word	access_right_service	sets the Pmpp Port of the pmpp server(0: off)	

CONF_PMPP_ADDRESS

Tag code		NumDes	Message	SNMP Support
0x0ab9		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	gets the Pmpp Address (allowed values: 1-63;)	
Write	t_octet	access_right_service	sets the Pmpp Address (allowed values: 1-63;)	

CONF_SYSCONTACT

Tag code		NumDes	Message	SNMP Support
0x00ba		no	no	yes
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the system contact required in SNMP	
Write	p_string	access_right_service	write the system contact required in SNMP	

CONF_SYSLOCATION

Tag code		NumDes	Message	SNMP Support
0x00bb		no	no	yes
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	read the system location required in SNMP	
Write	p_string	access_right_service	write the system location required in SNMP	

CONF_SNMP_READ_COMMUNITY

Tag code		NumDes	Message	SNMP Support
0x0b16		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	read the community string for snmp read access	
Write	p_string	access_right_service	write the community string for snmp read access	

CONF_SNMP_WRITE_COMMUNITY

Tag code		NumDes	Message	SNMP Support
0x0b17		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_service	read the community string for snmp write access	
Write	p_string	access_right_service	write the community string for snmp write access	

CONF_SNMP_TRAP_COMMUNITY

Tag code	NumDes	Message	SNMP Support
0x0b18	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_service	read the community string used in snmp traps
Write	p_string	access_right_service	write the community string used in snmp traps

CONF_SNMP_SERVER_MODE

Tag code	NumDes	Message	SNMP Support
0x0c4e	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_service	Read the snmp server mode (0=v1 legacy mode; 1=v1; 8=v3; 9=v1+v3)
Write	t_octet	access_right_service	Write the snmp server mode (0=v1 legacy mode; 1=v1; 8=v3; 9=v1+v3); Support for options 1=v1 and 9=v1+v3 removed in V6.50 and later

CONF_SNMP_USER_PROFILE

Tag code	NumDes	Message	SNMP Support
0x0c4f	yes 1=(static bound to local service user profile and its auth-password); 3=(profile for a remote account sending SNMP traps to)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	Read a snmp (non-legacy) mode user profile
Write	p_octet	access_right_service	Write a snmp (non-legacy) mode user profile

Payload Structure

16		32	
UserName 32 Bytes ...			
AuthPass 32 Bytes ...			
PrivPass 32 Bytes ...			
AuthMode 1 Byte	PrivMode 1 Byte	SnmpVersion 1 Byte	IsTrapUser 1 Byte
Profile 1 Byte	Reserved11 1 Byte	Reserved12 1 Byte	Reserved13 1 Byte
Reserved2 4 Bytes			
Reserved3 4 Bytes			
Reserved4 4 Bytes			

UserName

Zero terminated string with user name. Or zero to delete this user entry.

Values:

AuthPass

Zero terminated string with authentication password.

Values:

PrivPass

Zero terminated string with privacy password.

Values:

AuthMode

Authentication mode

Values:

No authentication	1
MD5 authentication	2
SHA1 authentication	3

PrivMode

Privacy mode

Values:

No privacy	1
DES privacy	2
AES privacy	4

SnmpVersion

SNMP version for this user

Values:

SNMP Version 3	3
----------------	---

IsTrapUser

Define if this account is a local account or a account to sent traps to

Values:

Local account	0
Remote trap account	1

Profile

Select one of the access rights profiles

Values:

Read only profile	0
Read write profile	1

Reserved11

Should be zero

Values:

Reserved12

Should be zero

Values:

Reserved13

Should be zero

Values:

Reserved2

Should be zero

Values:

Reserved3

Should be zero

Values:

Reserved4

Should be zero

Values:

CONF_STREAMING_GATEWAY_CONFIG

Tag code		NumDes	Message	SNMP Support
0x0b24		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read streaming gateway configuration, see detailed description	
Write	p_octet	access_right_service	write streaming gateway configuration, see detailed description	

Payload Structure

gateway line 16 Bits		gateway stream 8 Bits	action 8 Bits
protocol 8 Bits	version 8 Bits	connection 8 Bits	reserved 8 Bits
manufacturer id 32 Bits			
device type 32 Bytes ...			
...			
optional parameters 1 M Bytes			
N x M Bytes	optional parameters N M Bytes ...		

gateway line

local line of streaming gateway id

gateway stream

local stream of streaming gateway starting with 0 for the first stream

action

action for write direction, choose between add camera and remove camera, in case of remove camera, except this field, "gateway line", "gateway stream" and "version" all other fields in the payload are irrelevant

Values:	
add camera	0
remove camera	1

protocol

choose protocol type

Values:	
none	0
onvif	1
jpeg	2
bosch	3
rtsp	4
rtsp h263	5
rtsp h264	6
rtsp jpeg	7

version

version of the command, current version is 1

connection

connection type

Values:	
udp unicast	0
udp multicast	1
tcp	2

manufacturer id

distinguish between bosch cameras and foreign cameras

Values:	
unknown	0

device type

max 32 ascii characters including zero termination

optional parameters 1 - N

optional additional parameters, if nessessary depends on the camera

STREAMING_GATEWAY_CONFIG

This command is used to read and write the configuration of the streaming gateway. For the read direction only "gateway line" and "gateway stream" parameter are relevant for the send direction. The reply payload will contain the full parameter set. For write direction use the full parameter set to configure a streaming gate camera, if the action is "add camera". Depending on the camera type and connection type, additional optional parameters are nessessary. E.g. the device simulator is able to connect to another bosch camera or device specified by the url ([ip]:[port]/[line (1,2,...)])/[coder idx (1,2,...)]). E.g. with url "10.1.10.20:80/1/1" it connects to the device on ip 10.1.10.20 and port 80 on the first line and the first video encoder.

Payload Structure for optional parameters

optional parameters

the optional parameters contain additional parameters. Depending on the camera type and connection, these parameters may be nessessary (e.g. url for connecting a remote device).

type

type of the optional parameters

<u>Values:</u>	
none	0
url	1
stream	2
camera token	3
profile token	4

size

size in bytes of the following payload region excluding the "type" and "size" field. Has to be 4 byte aligned.

payload

payload for the additional parameter, structure depends on the "type"

url

zero terminated ascii string containing the url of the remote camera. Length of the string including zero termination is limited by the "length" of the optional parameter

stream

remote camera line	16 bit network order
remote camera stream	8 bit
reserved	8 bit

camera token

see detailed description for camera token

profile token

see detailed description for profile token

CONF_STREAMING_GATEWAY_ACTIVE_LINES

Tag code		NumDes	Message	SNMP Support
0x0b25		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the number of configured streaming gateway lines	
Write	t_dword	access_right_service	not supported	

CONF_STREAMING_GATEWAY_MAX_LINES

Tag code		NumDes	Message	SNMP Support
0x0b26		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the max number of configurable streaming gateway lines	
Write	t_dword	access_right_service	not supported	

CONF_ISCSI_IP

Tag code		NumDes	Message	SNMP Support
0x09aa		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	deprecated in fw > 4.00	
Write	t_dword	access_right_service	deprecated in fw > 4.00

Tag code		NumDes	Message	SNMP Support
0x09ab		yes (since fw > 4.00)	no	no
Datatype		Access Level	Description	
Read	t_word	access_right_minimal	numdes 0: connect port, 1: tunnel port, 2: server port	
Write	t_word	access_right_service	numdes 0: connect port, 1: tunnel port, 2: server port	

CONF_ISCSI_LUN

Tag code		NumDes	Message	SNMP Support
0x09ac		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	deprecated in fw > 4.00	
Write	t_dword	access_right_service	deprecated in fw > 4.00	

CONF_ISCSI_TARGET_IDX

Tag code		NumDes	Message	SNMP Support
0x09f9		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	deprecated in fw > 4.00	
Write	t_dword	access_right_service	deprecated in fw > 4.00	

CONF_ISCSI_TARGET

Tag code	NumDes	Message	SNMP Support
0x09ad	no	no	no
Datatype	Access Level	Description	
Read	p_string	access_right_minimal	gets the iscsi target name string
Write	p_string	access_right_service	deprecated in fw > 4.00

CONF_ISCSI_TCP_CONNECTIONS

Tag code	NumDes	Message	SNMP Support
0x09ae	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	get the number of concurrent tcp connections to iscsi target
Write	t_dword	access_right_service	set the number of concurrent tcp connections to iscsi target

CONF_ISCSI_DISCOVERY

Tag code	NumDes	Message	SNMP Support
0x09cc	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	performs a discovery and returns the result in an XML-like string; parameter ip (DWORD) and pwd string (64 char) structure in p_octet
Write	void	access_right_service	not supported

CONF_ISCSI_TARGET_PWD

Tag code		NumDes	Message	SNMP Support
0x09ce		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_user	set the password to authenticate at the iSCSI server. FW version >= 4.00: This command sets the password of the first entry of the CONF_ISCSI_AUTH list. If all characters of the string are the '*', the old stored value is not replaced. deprecated! use CONF_ISCSI_AUTH	
			get the password to authenticate at the iSCSI server. FW version >= 4.00: This command returns the password of the first entry of the CONF_ISCSI_AUTH list. deprecated! use CONF_ISCSI_AUTH	
Write	p_string	access_right_service		

CONF_ISCSI_LOCK_OVERRIDE

Tag code		NumDes	Message	SNMP Support
0x09d2		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	see detailed description	
Write	p_string	access_right_service	see detailed description	

Payload

A String with the following structure - target_id:target_idx:lun

This string identifies the iscsi lun on which the lock is to be overwritten. This option clears its value after a successful override.

Note

The datatype of this command was FLAG and changed to STRING with fw 2.50. The target_id needs o be resolved by rules configured by CONF_TARGET_ID_RESOLVE_RULES. In older version the target id was the ipv4 address, which is now the default rule for target id resolving. The string format of the target id is the same as of the ipv4.

CONF_ISCSI_LOCK_RELEASE_ON_LEAVE

Tag code		NumDes	Message	SNMP Support
0x09e4		no	no	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	returns wheather the next iSCSI logout should use the release action	
Write	%	access_right_service	%	

CONF_ISCSI_INITIATOR_NAME

Tag code		NumDes	Message	SNMP Support
0x09d8		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	returns the used initiator name; only applicable when iSCSI is connected	
Write	void	access_right_service	not supported	

CONF_ISCSI_INITIATOR_NAME_EXTENTION

Tag code		NumDes	Message	SNMP Support
0x09d9		no	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	returns the used initiator name extention; used for identification only	
Write	p_string	access_right_service	set the used initiator name extention; used for identification only	

CONF_ISCSI_SERVER_STATE

Tag code		NumDes	Message	SNMP Support
0x0a2b		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	returns the state of the iscsi server (0: server down, 1: server running)	
Write	t_dword	access_right_service	set the iscsi server state (0: shutdown server, 1: start server)	

NOTE

The iscsi server is also started or stopped when you write the command CONF_STORAGE_LIST. If the storage list is empty or only contains entries with the 'iSCSI export' field set to 'For local use only' (0x00), the server is stopped if it is running cause no targets and luns would be provided. If the list contains at least one entry with the 'iSCSI export' field set to 'Make storage available through iSCSI' (0x01), the server is started, if not already running, to provide the iscsi service.

CONF_ISCSI_MNI

Tag code	NumDes	Message	SNMP Support
0x0aa0	no	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	monitor iscsi targets.
Write	p_octet	access_right_service	monitor iscsi targets.

Target Descriptor

Session Status	Session Error	Reconnects
1 Byte	1 Byte	2 Byte
Reserved		
4 Bytes		
Uptime		
4 Bytes		

8

24

Target Address

See request packet for details.

Action

The value of the request packet. Zero in messages.

Status

Values:

FAIL	0x00
SUCCESS	0x01

Error

Values:

ISCSI_MNI_ERR_INV_TARG	0x01
ISCSI_MNI_ERR_FULL	0x02
ISCSI_MNI_ERR_TARG_PRESENSE	0x03
ISCSI_MNI_ERR_NOT_FOUND	0x04
ISCSI_MNI_ERR_INTERNAL	0x05

When an action request fails, this error field is set. On success or messages, this field is zero.
ISCSI_MNI_ERR_INV_TARG - if the assigned target address is invalid (e.g. zero).
ISCSI_MNI_ERR_FULL - if the maximum of 64 iSCSI targets is reached and a request packet with the ADD action was sent.
ISCSI_MNI_ERR_TARG_PRESENSE - if a request packet if the ADD action was sent and the target address is already monitored.
ISCSI_MNI_ERR_NOT_FOUND - if a request packet if the DELETE action was sent and the target address is not currently monitored.

Target IP

The IP address of the iSCSI target.

Target Index

The index of the iSCSI target.

Starttime

The time when the monitoring process was started (in seconds since 2000).

Session Status

Values:

OFFLINE	0x00
ONLINE	0x01
ERROR	0x02

Session Error

Values:

ISCSI_ERR_CONNECT	0x31
ISCSI_ERR_LOGIN	0x34
ISCSI_ERR_INV_TARG_IDX	0x35
ISCSI_ERR_PWD	0x36
ISCSI_ERR_PROTO	0x37
ISCSI_ERR_TARG_NOT_REACH	0x38
ISCSI_ERR_NO_MEM	0x3a
ISCSI_ERR_SESS_CREATE	0x3b
ISCSI_ERR_INV_PARAMS	0x3c
ISCSI_ERR_SESS_NOT_FOUND	0x3d
ISCSI_ERR_DISCONNECT	0x3e
ISCSI_ERR_TIMEOUT	0x3f
ISCSI_ERR_SOCKET	0x5f
ISCSI_SOCKET_CLOSED	0x7f
ISCSI_ERR_TCP_CONN_RST	0x8f
ISCSI_ERR_IP_ZERO	0xa0

Reconnects

The number of times the session was reconnected since the begin of the monitoring process.

Uptime

The number of seconds the session is online.

Use this command to monitor iscsi targets.

If you write this command, all the targets of the request packets are added/delete to the current monitoring list.

If you read this command, you will get the description of all currently monitored iscsi targets in the response packet.

Every time the status of a monitored target changes, a message is sent out with the current status of this target.

CONF_ISCSI_AUTH

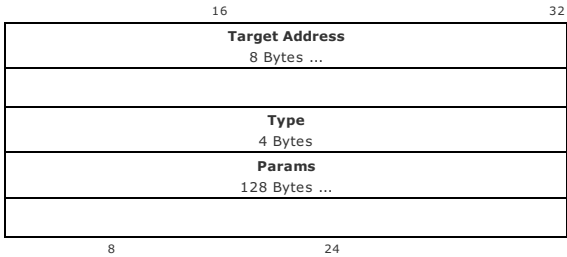

Tag code	NumDes	Message	SNMP Support
0x0ab0	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_user	see detailed description
Write	p_octet	access_right_service	see detailed description

Payload Structure

Sequence of (BVIP enc/dec: 2, generic dll: 8):

Authentication Descriptor

Target Address

The address of the iscsi target. If this field is set to zero, it is used as the default entry for authentication.

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES). If this field is set to -1 (0xFFFFFFFF), this descriptor is used for all remaining targets, for that no explicit descriptor is provided (default).

Target Index

The target index of the iscsi target. If this field is set to -1 (0xFF), this descriptor is used for all remaining iscsi targets with the same ip, for that no explicit descriptor is provided (default).

Flags

Values:	
http tunnel	0x01
not for target	0x02

Target Port

The port of the iscsi target. If this value is set to zero, the port configured in CONF_ISCSI_PORT is used.

NOTE

For an iscsi session, all authentication descriptors are searched for the target address. If this address is found, the authentication information is used.

If that descriptor is not found, but the array contains a descriptor with the same ip and the target index set to default (0xFF), the information in this record is used instead.

If that descriptor is not found, but the array contains an descriptor with the ip address set to default (0xFFFFFFFF), the information in this record is used instead.

If that descriptor is not found, no authentication will be performed for that iscsi session.

Type

Values:

NONE	0
CHAP	1
SMB	2

Params

(If Type != NONE)

User

The user name that is used for authentication.

Password

The password that is used for authentication (CHAP: N = 64 Bytes, SMB: N = 32 Bytes).

NOTE

On a read command, the characters of the password are replaced by the '*'. On a write command, the password is only stored, if not all characters equal the '*' sign. Otherwise the old stored value is retained.

CONF_ISCSI_SEG_SIZE

Tag code		NumDes	Message	SNMP Support
0x0aff		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	Maximum segment size for ISCSI transfers (should be a 2^n value like 8192, 16384 or 65536)	
Write	t_dword	access_right_service	Maximum segment size for ISCSI transfers (should be a 2^n value like 8192, 16384 or 65536)	

CONF_ISCSI_DATARATE

Tag code		NumDes	Message	SNMP Support
0x0b00		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	KBit/s the ISCSI should transmit as maximum (0:=no limit send all data at once)	
Write	t_dword	access_right_service	KBit/s the ISCSI should transmit as maximum (0:=no limit send all data at once)	

CONF_ISCSI_LOWERDATARATE

Tag code		NumDes	Message	SNMP Support
0x0b47		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	KBit/s the ISCSI lower Limit for the Iscsi Data rate Throttling	
Write	t_dword	access_right_service	KBit/s the ISCSI lower Limit for the Iscsi Data rate Throttling	

CONF_ISCSI_READDATARATE

Tag code		NumDes	Message	SNMP Support
0x0b3a		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	KBit/s the ISCSI should read as maximum (0:=no limit send all data at once)	
Write	t_dword	access_right_service	KBit/s the ISCSI should read as maximum (0:=no limit send all data at once)	

CONF_ISCSI_MULTIPATH

Tag code		NumDes	Message	SNMP Support
0x0bee		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the behaviour of iSCSI multipathing (0=off, 1=only use prefered pathes, 2=use all pathes, 3=use NetApp specific path selection)	
Write	t_dword	access_right_service	set the behaviour of iSCSI multipathing (0=off, 1=only use prefered pathes, 2=use all pathes, 3=use NetApp specific path selection)	

CONF_ISCSI_MULTIPATH_STATE

Tag code		NumDes	Message	SNMP Support
0x0c14		no	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	Read the multipathing state of all active iSCSI connections	
Write	p_octet	access_right_minimal	not supported	

Payload Structure

The message normally contains one or more 0x00 tags or one 0x04 tag if there is no active iSCSI connection. Inside the 0x00 tag there should appear one 0x01, 0x05, 0x02, 0x03 and 0x06 tag.

16		32	
Length	2 Byte	First Group Tag (0x8000)	2 Byte
Length	2 Byte	First Subtag	2 Byte
Payload (length - header) bytes			
Length	2 Byte	Second Subtag	2 Byte
Payload (length - header) bytes			
... Additional subtags (length - header) bytes			
Length	2 Byte	Next Group Tag (0x8000)	2 Byte
Length	2 Byte	First Subtag	2 Byte
Payload (length - header) bytes			
... Additional subtags (length - header) bytes			
... Additional group tags (length - header) bytes			
8		24	

If there is no active iSCSI connection at the moment the command just returns the 'No active connection' tag without any payload.

16		32	
Length	0x0004	Tag	0x0004

Length

Length of complete tag entry including length and tag field.

Values:

Length	0-65535
--------	---------

Tag

Tag describing the meaning of the following payload. See tag defintion below.

Values:

Group tag (Surrounds information for one connection)	0x8000
Main path IP	0x0001
Target index	0x0005
Connected IP	0x0002
Connection state	0x0003
Multipath support	0x0006
No active connection	0x0004

Payload

Binary payload. The meaning is defined trough the value of the tag field. The length is the amount of bytes given in the length field minus 4;

Values:

Binary data	0x..
-------------	------

Typical message

This is the payload when a target supports multipathing. The IP of the origin connection is 10.1.1.10. The target with index 2 on this IP is used. The connection runs over the IP 10.1.1.12 at the moment. This is a path which is marked as non optimized.

Length 0x001c	Group Tag 0x8000
Length 0x0008	Subtag 0x0001
IPv4 0x0a 0x01 0x01 0x0a	
Length 0x0008	Subtag 0x0005
Target Index 0x00 0x00 0x00 0x02	
Length 0x0008	Subtag 0x0002
IPv4 0x0a 0x01 0x01 0x0c	
Length 0x0008	Subtag 0x0003
Flags 0x00 0x00 0x1 0x00 (uint32 0x00000010)	
Length 0x0008	Subtag 0x0006
Multipath support 0x00 0x00 0x00 0x01 (uint32 0x00000001)	

8

24

When no iSCSI connection is requested/active at the moment (e.g. no recording running), the following payload is returned

Length 0x0004	Tag 0x0004
-------------------------	----------------------

Tags

The command contains the following tags:

Tag 0x8000: Group tag

One group is marked by the 0x8000 starting tag. Each group gives information about one active iSCSI connection. It normally contains one 0x0001, one 0x0005, one 0x0002 and one 0x0003 tag to describe the multipath state of the connection. The length field contains the length of all included subtags plus the group header itself. The group tag is present to simplify parsing and to join subtags to a unique connection description.

Tag 0x0001: Target IP

Original or main IP address of the iSCSI target. Through this IP the session was initially created. If the length field is 8 the payload is a IPv4 address (network byte order). If the length field is 20 the payload contains IPv6.

Tag 0x0002: Connected IP

The IP address the connection uses at the moment. This may be the IP of an alternative path. If the length field is 8 the payload is a IPv4 address (network byte order). If the length field is 20 the payload contains IPv6.

Tag 0x0003: Connection status

The payload is 4 byte containing a 32 bit value (DWORD) in network byte order. The value must be interpreted as a bit field with the following meaning:

Bit 0 (0x00000001)	The connection is offline and not in a working state.
Bit 1 (0x00000002)	The connection is connected via the main IP (main path or preferred path) and working optimized.
Bit 2 (0x00000004)	The connection is connected via an alternative path. So The connection runs optimized but not through the main path.
Bit 3 (0x00000008)	The connection runs through an alternative path which is not declared as being optimized or not optimized. Connection will go back to the main path when possible.
Bit 4 (0x00000010)	Connection runs on a non optimized path (lower performance) and will try to go back to an main path as soon as possible.
Bit 5 (0x00000020)	The session is about to be closed gracefully. There are no more users on this session and it will be closed.
Bit 6 (0x00000040)	The connection is connected via the main IP, but the regularly check of the availability of the alternative paths failed. So at least one alternative path might not be reachable.

Tag 0x0004: No active connection

If this tag is present as first tag, no other tags will be present in the message. It tells the receiver, that no active connection exists at the moment. So the iSCSI stack is idle.

Tag 0x0005: Target Index

The target index of the target which is addressed over the Target IP if multiple targets are available through this IP.

Tag 0x0006: Multipath support

If 0 the target has no multipath support and only one of the states Bit 0 (offline) and Bit 1 (connected optimized) is reported, as the target can only be on- or offline. It has no alternative pathes.

If this value is 1 the target supports multipathing and there are alternative pathes available. All states from above can be reported for the target.

CONF_ISCSI_FLUSH_DISVCACHE

Tag code	NumDes	Message	SNMP Support
0x0c19	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported
Write	p_octet	access_right_service	flush the ISCSI discovery cache. See detailed description

Payload Structure

Length

Length of the following tag including length and tag field.

Values:

Tag

Tag which describes the meaning of the following field. This command supports both variants of passing IP addresses. You can provide an IP with tag 0x01 either an IPv4 or IPv6. Then the length field indicates which IP version is included (4 = IPv4, 16 = IPv6). To pass IPv6 you can also use tag 0x02.

Values:

IPv4 or IPv6 Address. Indicated by the length field.	0x01
IPv6 Address	0x02
Target Index	0x03

Payload

Payload of the tag (4 bytes in case of IPv4, 16 bytes in case of IPv6). The target index has 4 byte payload and contains the target index in network byte order.

Values:

General Description

This command flushes one entry in iSCSI discovery cache. Providing an IP and target index is mandatory.

Tag 0x01: IPv4

The payload contains an IPv4 address in network byte order which is to be flushed in the discovery cache. The payload must be 4 bytes.

Tag 0x02: IPv6

The payload contains an IPv6 address in network byte order which is to be flushed in the discovery cache. The payload must be 16 bytes.

Tag 0x03: Target Index

The payload of this tag contains a target index. If there are multiple targets on one IP you can flush the cache for individual target entries by passing the target index in network byte order.

CONF_ISCSI_DISV_CACHE

Tag code	NumDes	Message	SNMP Support
0x0c30	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Read out discovery cache entries
Write	p_octet	access_right_service	Write one discovery cache entry. ##desc:.\doc\CONF_ISCSI_DISV_CACHE.htm##

Payload Structure

This command can be used to read and write individual entries of the discovery cache. The command supports reading and writing cache entries.

Read direction: Payload Structure

On input you can provide an IP address and/or a LUN number structured in the following tagged payload. IP addresses (tag 0x0001) can have the length 0x0008 (IPv4) or 0x0014 (IPv6). The Target Index tag (0x000b) must have the length 0x0008 and must contain a target index in network byte order The LUN tag (0x0002) must have the length 0x0008 and must contain a 32bit LUN number in network order. The payload can contain all three tags. With it's combination you can control the output of the command.

- If provide no parameters (tags) the command returns all known IP of all target indexes and LUNs in the discovery cache. Be aware, that the output could get too long for the output buffer and there might be missing entries
- If you only provide an IP address, the command will return all targets and all known LUNs and the paths for one IP in the discovery cache.
- If you provide both IP address and a target index, the command will return all known LUNs and the paths for one target in the discovery cache.
- If you only provide a LUN number, the paths for this LUN in all discovery cache entries will be returned. There is a reserved LUN number 0xFFFFFFFF which will always return only the first LUN of an entry in the discovery cache. If you provide this reserved LUN number without an IP address, you will get all entries in the discovery cache with only the paths for the first LUN. This is a good way to get the IP and target index of all known targets in the discovery cache without overflowing the output buffer.
- If you provide an IP address, a target index and a LUN number the command will return only the paths for this target and the given LUN.

The answer is structured as described in Cache Entry encoding. If there is no cache entry available which matches the given filter, the command returns the 'Tag 0x0003: No entry available' tag. In case of this command the tag always return 0x00000000 as error code (no error).

16	32
Length 2 Byte	Tag (0x0001, 0x0002 or 0x000b) 2 Byte
Payload (length - header) bytes	
Additional tags... n bytes	

Write direction: Payload Structure

In write direction the command expects the Cache Entry encoding described below. This encoded cache entry is written to the discovery cache. Cache entries which are written with this command are stored in persistent cache and are persistent over a device reset. In write direction this command must carry a valid external instance bitmask which has to be unequal 0. If it is 0 the command is returned with an error. To delete such an entry you must provide the Cache Entry encoding with only the target IP, target index and external instance tag. The entry is cleared, when all external instance bits are cleared.

Cache Entry encoding (answer payload for read, input payload for write)

Every cache entry is started with a surrounding start tag (0x8009) followed by the IP for which this entry was generated (tag 0x000a). After this IP entry the target index is indicated to resolve a unique target on this IP (tag 0x000b). A surrounding tag (0x8008) marks one LUN entry which has several path entries, each surrounded by a 0x8004 tag. If there is no entry the 'Tag 0x0003: No entry available' tag is returned.

16	32
Length 2 Byte	Cache entry Tag (0x8009) 2 Byte
Length 2 Byte	Target IP tag (0x000a) 2 Byte
Payload (length - header) bytes	
Length 2 Byte	Target Index tag (0x000b) 2 Byte
Payload (length - header) bytes	
Length 2 Byte	IQN string tag (0x000c) 2 Byte
IQN string (length - header) bytes	
external instance bitfield tag	

Length 2 Byte	(0x000d) 2 Byte
External instance bitfield (32bit) (length - header) bytes	
Length 2 Byte	LUN Entry Group Tag (0x8008) 2 Byte
Length 2 Byte	Path Entry Group Tag (0x8004) 2 Byte
Length 2 Byte	Path IP Tag (0x0005) 2 Byte
IP of the path (16 or 4 byte length) (length - header) bytes	
Length 2 Byte	LUN Tag (0x0006) 2 Byte
LUN number on this path (length - header) bytes	
Length 2 Byte	Flags Tag (0x0007) 2 Byte
Flags see below (length - header) bytes	
... Additional Path Entry Group Tag (0x8004) (length - header) bytes	
... Additional LUN Entry Group Tag (0x8008) (length - header) bytes	
... Additional Cache entry Tag (0x0009) (length - header) bytes	

In case of an error or there is no matching cache entry the following payload is returned:

16	32
Length 0x0008	Tag 0x0003
Error code (4bytes network order)	

Length

Length of complete tag entry including length and tag field

<u>Values:</u>	
Length	0-65535

Tag

Tag describes the meaning of the following payload. See tag definition below.

<u>Values:</u>	
Discovery cache entry tag	0x8009
Target IP	0x000a
Target Index	0x000b
IQN string	0x000c
External instance	0x000d
LUN entry tag	0x8008
Path entry	0x8004
Path IP	0x0005
LUN	0x0006
Flags	0x0007

Typical message

This is the payload for a command which addresses (10.1.1.10), target index 3 and one individual LUN (4).

Input data:

16	32
Length 0x0008	IP tag 0x0001
IPv4 0x0a 0x01 0x01 0x0c	
Length 0x0008	Target Index 0x000b
Target Index 0x00 0x00 0x00 0x03	
Length 0x0008	Subtag 0x0002
LUN 0x00 0x00 0x00 0x04	

Output data

Flags bitfield 0x00 0x00 0x00 0x07	
More Paths (0x8004) ...	

When no cache entry is available, the following payload is returned:

	16	32
Length 0x0004		Tag 0x0003

Tags

The command contains the following tags:

Tag 0x8009: Cache entry tag

Each cache entry start with this tag and is followed by an target IP tag. If there is no multipathing information, there will be no following 'LUN entry tags'.

Tag 0x000a: Target IP

Original or main IP address of the iSCSI target. Through this IP the session was initially created. If the length field is 8 the payload is a IPv4 address (network byte order). If the length field is 20 the payload contains IPv6.

Tag 0x000b: Target Index

Target index on the main IP. This is the index of the target if there are multiple targets available on one IP.

Tag 0x000c: IQN string

IQN string of the target. This is the unique name identifier the target returns at discovery and which is needed at login state to address the target. In multipathing this IQN is used for all connection IP addresses.

Tag 0x000d: External instance

The external instance is a 32 bit wide bitfield. It is used to identify who has set this cache entry. In VRM environment the first VRM may set bit 0. The secondary VRM will use bit 1. With this bitfield it is tracked, who wrote this cache entry. If one instance deletes the cache entry, only the bit used by this instance is cleared. If any other bits are still set, the entry is not deleted. When this bitfield becomes zero at a delete request, the entry is really deleted. **ATTENTION:** This field must always have a value other then 0. Writing a cache entry from outside world with external instance equal 0 will cause a write error.

Tag 0x8008: LUN entry

Surrounding tag for one LUN entry. This tag will have several 'Path entry' tags as subtags.

Tag 0x8004: Path entry

Tag which marks one path entry. The first path entry will always be the path on the main path. This entry will have the following subtags:

Tag 0x0005: Path IP

IP address of this path. If the length field is 8 the payload is a IPv4 address (network byte order). If the length field is 20 the payload contains IPv6.

Tag 0x0006: LUN number

The number of the LUN the LUN will have on this path. The first entry in the paths list marks the LUN number on the main path.

Tag 0x0007: Flags

Conditions for this path

Bit 0 (0x00000001)	Target supports TPGS (Target Portal Group Support) on this path. Necessary for proper multipathing support.
Bit 1 (0x00000002)	This path is a preferred path
Bit 2 (0x00000004)	This path is an active path (but maybe not preferred if bit 1 is cleared).
Bit 3 (0x00000008)	This path is not optimal and should only be used as backup path in case of all preferred paths fail.

Tag 0x0003: No entry available

If this tag is present as first tag, no other tags will be present in the message. It tells the receiver, that there are no matching discovery cache entries. The tag is followed by an error code (4 byte in network order). If the error code is 0x00000000 (ISCSI_ERR_NONE) there was simply no existing cache entry available. For CONF_ISCSI_DISV_CACH command the error code is always 0x00000000. For CONF_ISCSI_MP_DISCOVERY any of the defined ISCSI error codes can occur.

ISCSI_ERR_NONE	0x00
ISCSI_ERR_CONNECT	0x31
ISCSI_ERR_INV_LUN	0x33
ISCSI_ERR_LOGIN	0x34

CONF_ISCSI_MP_DISCOVER

Tag code	NumDes	Message	SNMP Support
0x0c32	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Do a multipath discover
Write	p_octet	access_right_service	not supported

Payload Structure

The payload must contain the tag 0x0001 **and** the tag 0x0002. Optionally you can pass one or more tag 0x0003 to tell the command to only scan the given pathes. The payload of the tag 0x0001 and tag 0x0003 can either be IPv4 or IPv6. Which IP is contained is indicated by the tag length. 0x0008 is IPv4 0x0014 is IPv6.
The tag 0x0002 indicates a target index.

16		32

OPTIONAL			
1 or more 0x0003 tag indicating alternative pathes to scan.			
Length	2 Byte	Tag (0x0003)	2 Byte
IPv4 or IPv6			
4 or 16 Bytes			

Length

Length of the following tag including length and tag field.

Values:

Tag

Tag which describes the meaning of the following field

Values:

IP Address	0x0001
Target Index	0x0002
Alternative path	0x0003

Payload

Payload of the tag 0x0001 (4 bytes in case of IPv4, 16 bytes in case of IPv6) indicates the main path to the target to scan.

Payload of the tag 0x0002 is the target index (4 byte number) on network byte order

Payload of each tag 0x0003 (4 bytes in case of IPv4, 16 bytes in case of IPv6) gives the IP of an alternative path to scan. If not given all found pathes are scanned.

General Description

This command initiates a multipath discovery of a target. This means iSCSI stack tries to detect all known alternative pathes for all LUNs for the given main path.
The user can select alternative pathes to be scanned with the 0x0003 tag. If no 0x0003 tag is given all pathes found at discovery are scanned.
ATTENTION: The command can take up to the amount of scanned pathes multiplied with 10 seconds to complete! This scan does not create any persistent discovery cache entries. All cached data is cleared after the scan.

Response

Response payload

The payload of the response is an encoded discovery cache entry which show the scan result. The format is the same is described in the CONF_ISCSI_GET_DISV_CACHE command.

iSCSI specific errors

The following specific erros might be returned on RCP level. If such an error occurs the command was not executed.
ISCSI_ERR_INV_PARAMS (0x3c) - Error parsing the command (error in tag structure)
ISCSI_ERR_TARGET_SESSION_LIMIT (0x41) - Too many scan active (only one to the same IP is allowed). Retry later.
ISCSI_ERR_NO_MEM (0x3a) - No free job to do the scan. Retry later.

The command can also return the 'No cache entry' tag (0x0003) followed by an error code. With this the command returns errors which occur while discovering the target. All known iSCSI error codes can occur there (see CONF_DISV_CACHE for a list of error codes).

CONF_HD_PARTITION_FILE_INFO

Tag code	NumDes	Message	SNMP Support
0x0901	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	returns a list of files of a replay session (session id needed). This command works for local replay only. See detailed description
Write	void	access_right_user	not supported

This command initiates a search to get the times where data is available within a recording.

The Session ID paramter must be set (a connect primitive must have been preceded). Recording mode can be time recording (1) or alarm recording (2 and 3), only for command CONF_SPAN_PARTITION_FILE_INFO there are seperagte files for pre (2) and post (3) alarm recording.

Search is performed from a start point on the timeline towards an end point. If the end point is prior to the start point search is performed backwards.

To get all available results of an recording a search from 0 to 0xFFFFFFFF needs to be done.

The number of results is limited to 256 per response. The result are always in ascending order independent if the search is performed forward or backward. The File ID always increases on span recording regions if new files will be created.

To get all results the command has to be called multiple times.

In that case the start or stop times needs to be updated with every call: If a forward search is executed the start time of the next request must be the stop time of the last retrieved result. If a bachward search is executed the start time of the next request must be the start time of the first retrieved result.

A search is completed if the number of returned results is smaller than 256 or if the endpoint of the search is greater or equal than than the endpoint of the last result. In case of forward search a virtual start point (equal to the start point of the search) will be inserted if the search start point is range with recording.

- Some examples: Forward search (data is available from time A to time B):
1. A search is executed from time 0 to time B. In that case the reponse is: secStart=A, secStop=B
 2. A search is executed from time 0 to time 0xFFFFFFFF. In that case the reponse is: secStart=A, secStop=B
 3. A search is executed from time C (C > A and C < B) to time B. In that case the reponse is: secStart=C, secStop=B
 4. A search is executed from time A to time C (C > A and C < B). In that case the reponse is: secStart=A, secStop=C

- Backward search (data is available from time A to time B):
1. A search is executed from time 0xFFFFFFFF to time A. In that case the reponse is: secStart=A, secStop=B
 2. A search is executed from time 0xFFFFFFFF to time 0. In that case the reponse is: secStart=A, secStop=B
 3. A search is executed from time C (C < B and C > A) to time A. In that case the reponse is: secStart=A, secStop=C
 4. A search is executed from time B to time C (C < B and C > A). In that case the reponse is: secStart=C, secStop=B

Seconds since 2000.

Flags

Values:

Bit 0	Recording Running (actual recording is running on this file or recording not closed regularly)
Bit 1	Recording Overwriting (recording takes place in a ring and old recording data will be overwritten)
Bit 2	Alarm Input (there are input alarms in this file)
Bit 3	Alarm Motion (there are motion alarms in this file)
Bit 4	New Alarm (obsolete)
Bit 5	Video Loss (there are video loss in this file)
Bit 6 - 7	Recording mode: 1 - time recording, 2 - alarm recording (pre alarm), 3 - alarm recording (post alarm) value 2 and 3 only in CONF_SPAN_PARTITION_FILE_INFO distinguishable, for CONF_PARTITION_FILE_INFO these two values have the meaning of a full alarm rec file
Bit 8-15	Track Fill Level (fill level in percent, always 100 % on filled ring recording)
Bit 16	Alarm Remote (there are virtual/remote alarms in this file, see CONF_HD_MGR_SIGNAL_ALARM)
Bit 17	Audio (there are audio data in this file)
Bit 18	Meta (there are meta data in this file)
Bit 19-20	Reserved
Bit 21	Offline (VRM only)
Bit 22	Protected (VRM only)
Bit 23-28	Time Zone (Quarter hours)
Bit 29	Time Zone Sign
Bit 30-31	Reserved

Fri. 1 4 Bits	94 x 4 Bits	Fri. 96 4 Bits			

Sat. 1 - 96

96 entries of recording profile numbers for Saturday, each represents the recording profile for a 15 min time period. First entry is from 00:00 to 00:15. The following entries are for the following 15 min time periods until 24:00.

Values:	
recording off	0
recording profile numbers	1-10

Sun. 1 - 96

96 entries of recording profile numbers for Sun.

Mon. 1 - 96

96 entries of recording profile numbers for Mon.

Tue. 1 - 96

96 entries of recording profile numbers for Tue.

Wed. 1 - 96

96 entries of recording profile numbers for Wed.

Thu. 1 - 96

96 entries of recording profile numbers for Thu.

Fri. 1 - 96

96 entries of recording profile numbers for Fri.

HD_RECORD_SCHEDULE

This command reads/writes the recording schedule for all cameras (primary and secondary recording). The entries are 4 bit each and represent a recording profile for a 15 min time period(payload 336 bytes total). The recording profiles with same profile number can be different for each camera. See command HD_RECORD_PROFILES. The schedule will be written to the storage medium. In case of span recording mode (see CONF_RECORD_MODE_SPANS) the schedule will be only read from or stored in the config. This schedule is used as default schedule for each span that is mounted by this device for recording.

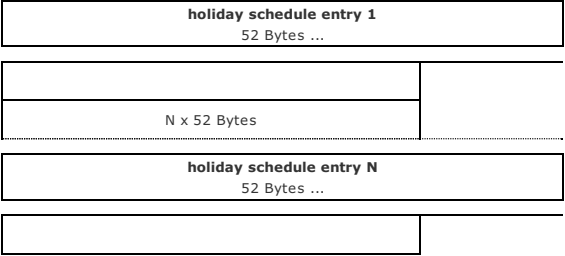

CONF_HD_RECORD_SCHEDULE_SECONDARY

Tag code		NumDes	Message	SNMP Support
0x0a49		no	no	no

CONF_HD_RECORD_HOLIDAYS

Tag code		NumDes	Message	SNMP Support
0x0a0c		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	read holiday schedule list for primary recording, see detailed description	
Write	p_octet	access_right_service	write holiday schedule list (effect takes place imidately), see detailed description	

Payload Structure

holiday schedule entry 1 - N

schedule entry specifying a holiday and it's recording schedule. max. 25 entries.

CONF_HD_RECORD_HOLIDAYS

This command reads/writes the Holiday table for the primary recording. On holidays the recording uses the special schedule instead of the standard schedule. The table contains N entries (max. 25) each entry specifies one or more holidays in a row followd by a recording schedule. the payload sends only valid holiday entries, so the size of N depends on the number of valid entries in the table.

Holiday Schedule Entry Structure

day 1 Byte		month 1 Byte	year 1 Byte	number of days 1 Byte
reco 1 4 Bits	94 x 4 Bits	reco 96 4 Bits		

day

day of the month, which is a holiday

Values:

invalid	0
day of the month	1 - 31

month

month of the year

Values:

invalid	0
jan	1
feb to nov	2 - 11
dec	12

year

year since 2000

Values:

year 2000 to 2255	0 - 255
-------------------	---------

number of days

number of days that follow the specified holiday, which are also scheduled as holidays. If only the specified date is the holiday, this field should be set to 1.

Values:

invalid	0
number of days	1 - 255

record schedule 1 - 96

this is the recorcing schedule containing 96 entries of recording profile numbers for the holiday, each represents the recording profile for a 15 min time period. First entry is from 00:00

to 00:15. The following entries are for the following 15 min time periods until 24:00.

Values:

recording off	0
recording profile numbers	1 -10

flags

Flags:		
ALARM_RECORDING_PRE_ALARM_RING	0x01	flag for alarm recording, if set alarm recording on the alarm tracks will be active and pre alarm will be recorded into a ring on the storage
AUDIO_RECORDING_DISABLE	0x02	flag for audio recording, if set audio will be disabled for recording
		flag for meta recording, if set

META_RECORDING_DISABLE	0x04	meta will be disabled for recording
ALARM_FILE_BACKUP	0x08	flag for alarm file backup, if set alarm file back up will be active
ALARM_RECORDING_PRE_ALARM_BUFFER	0x10	flag for alarm recording, if set alarm recording on the alarm tracks will be active and pre alarm will be recorded into the recording buffer and will be flushed on alarm
ALARM_RECORDING_PRE_ALARM_AUTO	0x11	both flags for alarm recording, first the prealarm records into the recording buffer, if the prealarm time is to high for the buffer size, it starts recording into a ring on storage
IMMEDIATE_ALARM_BACKUP	0x20	immediate backup from record buffer
MANAGED_BY_ONVIF	0x40	a onvif video encoder configuration is active

video preset nr

video preset number used for recording

Values:

no recording on this profile	0
video preset nr	1 - 8

post alarm video preset nr

video preset number used for recording after occurrence of an alarm

Values:

not set, uses video preset nr if set	0
video preset nr for post alarm	1 - 8

encoder index

index of the encoder stream starting with 0, index 255 is for the backup output

cont rec backup

only for continuous buffered recording, if set the records will be backuped to the recording, its an alternativ way of configuration to using a backup account of typ record, that way no account is wasted in the configuration

back up account

Backup account Number from 0 (first account) to 3(fourth account), for choosing the back up account in case activated ALARM_FILE_BACKUP flag

profile name

profile name is a zero terminated string

max pre alarm time

only relevant for backup recording, it needs to know the max pre alarm time, in other cases it should be set to zero

pre alarm time

only relevant for alarm recording, if set, this time in seconds is the time the recording will be stored up to the alarm event

post alarm time

if set, this time in seconds is the time after an alarm event for that the post alarm video preset is used if set. After this time elapses, the recording will return to the standard video preset nr, if alarm recording, the recording will also stop the recording on the actual track and start a new one

motion alarm

The bits represents the activation. Bit 0 <-> Alarm Nbr. 1; Bit 1 <-> Alarm Nbr. 2; ; Bit 31 <-> Alarm Nbr. 32

alarm input and remote alarm

The bits represents the activation. Bit 0 <-> Alarm Nbr. 1; Bit 1 <-> Alarm Nbr. 2; ; Bit n <-> Alarm Nbr. n for alarm inputs (n = number of input alarms), Bit (32 - m) <-> Virt. Alarm Nbr. m; ; Bit 30 <-> Virt. Alarm Nbr. 2; Bit 31 <-> Virt. Alarm Nbr. 1 (reverse order) for virtual alarms caused by rcp command CONF_VIRTUAL_ALARM_STATE (m = number of virt. alarms)

video loss alarm

The bits represents the activation. Bit 0 <-> Alarm Nbr. 1; Bit 1 <-> Alarm Nbr. 2; ; Bit 31 <-> Alarm Nbr. 32

CONF_HD_RECORDING_REPORT

Tag code	NumDes	Message	SNMP Support
0x0a1c	yes (cam)	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get recording report from actual primary recording on a cam,
Write	p_octet	access_right_service	not supported

This comand reads the recording report of an actual running recording of a cam. The recording report contains information about RTP and VDP packets as well as VDP allocation of a running recording. The cam is specified by the num parameter.

Version 1

16	32
start_counting_time 4 Bytes	
VDP_allocation_no_wait 4 Bytes	
VDP_allocation_wait 4 Bytes	
VDP_allocation_failed 4 Bytes	
8	24

start_counting_time

time, since when the VDP allocation counting was started, this should be the time when the recording had started or since the last clear of the report.

VDP_allocation_no_wait

number of allocated VDPs since start_counting_time without blocking

VDP_allocation_wait

number of allocated VDPs since start_counting_time with blocking a time

VDP_allocation_failed

number of VDPs that couldn't allocated, because waiting for the at the block pool timed out or failed. Means also an rtp packet had to be discarded.

Version 2

16	32
Version 1 Byte	Reserved 3 Bytes
Start Seconds 4 Bytes	
Start Milliseconds 4 Bytes	
VDP Allocation No Wait 4 Bytes	
VDP Allocation Wait 4 Bytes	
VDP Allocation Fail 4 Bytes	
Encoder Data 48 Bytes ...	
Storage Data 48 Bytes ...	
Network Data 48 Bytes ...	
Reserved 48 Bytes ...	
8	24

Version

Version information.

Start Seconds

Timestamp in seconds since 2000 when the counting of recording data started.

Start Milliseconds

Milliseconds of the timestamp when the counting of recording data started.

VDP Allocation No Wait

Number of VDP allocation operation performed without waiting.

VDP Allocation Wait

Number of VDP allocation operation performed with waiting.

VDP Allocation Fail

Number of VDP allocation operation failed.

Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get the current recording status,
Write	p_octet	access_right_service	not supported

Request Structure

Camera

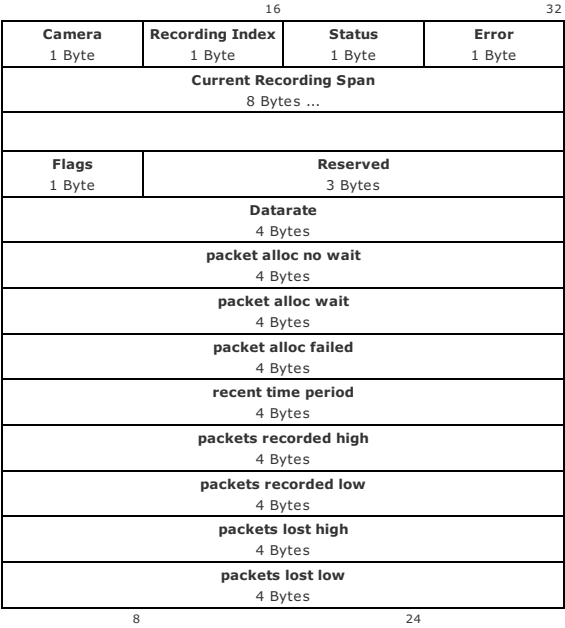

The camera index.

Recording Index

Values:

Primary	1
Secondary	2

Response Structure

Camera

The camera index.

Recording Index

Values:

Primary	1
Secondary	2

Status

Values:

OFFLINE	1	configured for not recording
IDLE	2	recorder is up and running on internal ram but no storage is configured for recording
PEND	3	trying to connect storage or waiting for block list from vrm
RUNNING	4	storage connected and recording running or prepared for recording
ERROR	5	error on storage occurred
REC_SRC_ERROR	6	error of recorder source(encoder)

Error

See error codes of CONF_SPAN_USE_STATUS.

Current Recording Span

The address of the span the camera is recording to.

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target Index

In index of the iscsi target.

Lun

The lun indentifier.

Span Index

The index of the span.

Flags

Values:

ENCRYPTION0x01encrypted recording

Datarate

The datarate that is written to the storage.

packet alloc no wait

recently alloc no wait vdp packets (1.5 kbyte) since recent time period

packet alloc wait

recently alloc wait vdp packets (1.5 kbyte) since recent time period (indicates problems of the recording get its data to the drive)

packet alloc failed

recently alloc failed vdp packets (1.5 kbyte) since recent time period (indicates problems of the recording get its data to the drive, corrupt data stream)

recent time period

time period in which the packet allock counter were counted

packets recorded high

high part (32 bits network order) of a 64 bit counter for all recorded packets of this recording since device start up (packets counted by "packet alloc no wait" and "packet alloc wait" not included)

packets recorded low

low part (32 bits network order) of a 64 bit counter for all recorded packets of this recording since device start up (packets counted by "packet alloc no wait" and "packet alloc wait" not included)

packets lost high

high part (32 bits network order) of a 64 bit counter for all packets, which couldn't be recorded by this recording since device start up (packets counted by "packet alloc failed" not included)

packets lost low

low part (32 bits network order) of a 64 bit counter for all packets, which couldn't be recorded by this recording since device start up (packets counted by "packet alloc failed" not included)

CONF_RECORDING_RETENTION_TIME

0x0a30		yes (camera)	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the primary recording retention time for a camera (in seconds).	
Write	t_dword	access_right_service	set the primary recording retention time for a camera (in seconds) (value >= 1009152000) means maximum, no influence on local recording, only for vrm managed recording. (effect takes place on next mounted span)	

CONF_RECORDING_RETENTION_TIME_SECONDARY

Tag code		NumDes	Message	SNMP Support
0x0a48		yes (camera)	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the secondary recording retention time for a camera (in seconds).	
Write	t_dword	access_right_service	Description : set the secondary recording retention time for a camera (in seconds) (value >= 1009152000) means maximum, no influence on local recording, only for vrm managed recording. (effect takes place on next mounted span)	

CONF_MAX_RECORDING_RETENTION_TIME

Tag code	NumDes	Message	SNMP Support
0x0b5b	yes (camera)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get the max recording retention time for a camera (in seconds), see detailed description
Write	p_octet	access_right_service	set the max recording retention time for a camera (in seconds), see detailed description

Payload Structure

max retention time

max retention in seconds, 0 or values bigger than about 32 years (value >= 1009152000) means maximum, in case of in payload for read direction, this field can be ignored and treaded as reserved field

rec idx

recording index

Values:	
primary recording	1
secondary recording (active low)	2

CONF_RECORDING_MAX_RETENTION_TIME

This command sets the max retention time for recording identified by the rec idx and the camera in the num parameter starting from 1. For read direction a inpayload is required with same format as described above, except the max retention time field can be ignored. The max retention time will be stored as absolute local time in seconds since 2000 in each span unit header. It will be used to clear a recording span when this time expires. If a max retention time is configured unequal 0 and less than maximum, the recording time on a span is limited to a one day time span. If this limit is reached by the recording, a span switch will be triggered.

CONF_REMOTE_REC_DEVICE

Tag code		NumDes	Message	SNMP Support
0x0a85		yes (max 8)	no	no
Datatype		Access Level	Description	
Read	p_string	access_right_minimal	Get the ip address or ign of the remote recording device (max. 50 characters).	
			Set the ip(ipv4 only) address or the ign (starting with "ign." or * for wildcard) of a remote recording device (max. 50 characters) on one entry ore use any free entry by num = 0, the ip/ign will be not added in that case if it is already in the list. To clear a entry send a empty string(zero termination only) on a valid index(1 - 8)	
Write	p_string	access_right_service		

CONF_REC_MGNT

Tag code		NumDes	Message	SNMP Support
0x0a89		no	no	no
Datatype		Access Level	Description	
Read	t_octet	access_right_minimal	Read the type of the recording management (0 = LOCAL, 1 = VRM, 2 = VRM+ANR, 3 = ONLY LOCAL (obsolete), 4 = DUAL VRM, 5 = ONVIF)	
			Set the type of the recording management (0 = LOCAL, 1 = VRM, 2 = VRM+ANR, 3 = ONLY LOCAL(obsolete), 4 = DUAL VRM, 5 = ONVIF) (not possible to change settings while recording)	
Write	t_octet	access_right_service

rec state	rec preset	enc preset	flags
1 Byte	1 Byte	1 Byte	1 Byte
8		24	

rec state

state of the recording, state OFF not in payload of msg

Values:

OFF	0
NO RECORDING	1
STAND BY	2
PRE ALARM RECORDING	3
ALARM RECORDING	4
POST ALARM RECORDING	5

rec preset

actual used recording preset from 1 to 10 or 0 if no preset is used

enc preset

actual used encoder preset from 1 to 8 or 0 if no preset is used

flags

these flags show the alarm states and the recording mode

Values:

alarm recording mode	0x01
input alarm	0x02
motion alarm	0x04
video loss	0x08
virtual alarm	0x10
reserved for extension	0x80

CONF_HD_MGR_REC_STATUS

This command shows the state for a recording. It can be read and it will be send at state changes. State changes are the change of rec state or rec preset only. Within the Msg there is no distiction between the state OFF and NO RECORDING. That means no msg will be send on the state change between this two states. The msg will never contain the state OFF but the read response maybe. OFF state means the recording is configured to off by set it to stop. NO RECORDING can be caused by many things e.g. no recording on the schedule, no storage present and so on. STAND BY means there is recording on the schedule but not at the moment. The recording scheduler waits for the time to start the recording. All the other states indicating a running recording. In case of alarm recording in prealarm state, the message state will be PRE ALARM RECORDING even if the pre alarm recording takes place in the ram only, if at least the storage is connected. If there is no storahge connected and recording is configured for running, the state will always be NO RECORDING.

CONF_HD_MGR_REC_STATUS_SECONDARY

8	24

cam

camera starting with 1 (in payload)

rec idx

recording index (in payload)

Values:

primary recording	1
secondary recording (active low)	2

full buffer bytes

full amount of buffer in bytes for recording on this device

allocated buffer bytes

actual allocated buffer for this recording

min buffer bytes

the minimum amount of buffer the recording would allocate

filled buffer bytes

the amount of buffer that contains data for recording (not the data which are recorded but still in buffer)

incommming data rate kBits per sec

incomming datarate in record buffer in KBit per sec (avarange over last seconds)

buffer time from utc

time stamp of oldest record data in buffer in seconds since 2000 utc

buffer time to utc

time stamp of latest record data in buffer in seconds since 2000 utc

buffer time recording utc

time stamp of record data in buffer to be recorded next in seconds since 2000 utc

recent buffer replay time utc

timestamp of last data requested by a buffer replay in seconds since 2000 utc

buffer replay byte cnt high

64 bit byte counter of replayed buffer replay data (upper 32 bit)

buffer replay byte cnt low

64 bit byte counter of replayed buffer replay data (lower 32 bit)

buffer replay cnt since utc

time in seconds since 2000 utc, since when the replay byte cnt counter is counting

buffer replay cnt since ms offset

milli seconds offset of the byte cnt counter time

buffer replay data rate kBits per sec

buffer replay datarate from record buffer in KBit per sec (avarange over last seconds)

CONF_HD_REC_BUFFER

This command gets information about the recording buffer size, it includes the full amount of buffer for all recordings, the allocated, and the minimum amount of buffer of the recording specified by the in payload. The "full buffer bytes" is usually preallocated memory at startup and won't change it's size as long as the device is running and is the same for all recordings (except streaming gateway). The "min buffer bytes" is the amount of buffer the device will at least allocate if running. The "allocated buffer bytes" is the amount of buffer the recording has actually allocated. This value can be higher than "min buffer bytes", if nt all possible recrdings are running. The unused buffer of non running recordings will be used by the running ones. If the recording is deactivated, the value will be 0. When running, the value wil be usually at least "min buffer bytes", but it can be temporary less than that value, if e.g. the recording was started shortly before and another already running recording has allocated the whole buffer. In that case it could take some time free the buffer by the running recording, so the allocated buffer will increase over the time. The "filled buffer bytes" is the amount of buffer memory of the the "allocated buffer bytes", which contains data for recording or in case of alarm recording, the amout to be recorded, if an alarm would occur in this moment. The "filled_buffer bytes" can therefor be used to calculate the fill level of the recording buffer. The information also includes the incomming data rate, which is the data rate of data from the video, audio, ... encoders to the record buffer. Also th time range of available data in buffer are presented along with the progress of the recording, all in seconds since 2000 utc. This is usefull to observe backlog of recording. Internally there are replay sessions running directly on the record buffer, therefor information about the buffer replay are also present, including the utc timestamp of the last replay data from buffer and byte counter and replay data rate.

CONF_MAX_GOP_LENGTH_VALUE

Tag code		NumDes	Message	SNMP Support
0x0b9d		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	Read the max gop length for recording	
Write	t_dword	access_right_service	Set the max gop length for recording, 0 means back to default	

CONF_ALARM_BACKUP_REC_SPEED_LIMIT

Tag code		NumDes	Message	SNMP Support
0x0bb0		line (1 ...n)	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_user	get the speed limit parameter, see detailed description	
Write	p_octet	access_right_service	set the speed limit parameter, see detailed description	

Payload Structure

speed limit

speed limit in percent (0 to 9999, default 200)

data rate limit

data rate limit in Kbps (0 - no limit, default 0)

CONF_ALARM_BACKUP_REC_SPEED_LIMIT

This command can be used to limit the data traffic caused by backupd recording per line (num parameter 1 to n). This can be done by limiting the data rate and/or the speed in percent(100 percent means backup speed like replay in normal speed), based on the time information of the video data. The backup can be stopped completely, by sending a speed limit by 0 and continued again by sending a non zero speed later. It cannot be stopped by the data rate, a value of 0 for the data rate means to disable the limit for the data rate. The data rate parameter isn't applied immediately, but when the next backup starts.

CONF_BACKUP_RECORDING_STATUS

Free Storage space in MB for the life data recording

backuped MB

Storage space in MB with records of the life data recording for this line, which are already backuped or which are not required to be backuped

unbackuped MB

Storage space in MB with records of the life data recording for this line, which have to be backuped or potentially required to be backuped, because they are in range of the max pre alarm time

lost counter

Counter for events of records, which had to be backuped and that couldn't be backuped, on deleting or overwriting by newer records

msg trigger

reason for sending this status

Values:

REQUESTED	0	response on request
ALL_CLEAR	1	all clear threshold passed
WARNING	2	warning threshold passed
DATA_LOSS	3	new data loss

CONF_BACKUP_RECORDING_STATUS

This command returns the backup recording status on a line, specified by the num parameter (1 ... n). First it looks for a valid configuration of backup recording. Valid means, there exists a running recording configured to record the life data and a second recording for backup, which copies the data from the life data recording storage to it's recording storage on alarm or continuously. If both "rec idx life" and "rec idx backup" are none zero, there is a valid configuration. Then the following fields inform about the status and progress of the backuped recording. The utilization of the life data recording storage can be calculated in percent with the equation: utilization = ("unbackuped MB" * 100)/("unbackuped MB" + "backuped MB" + "free MB"). The status will be send as message, if the utilization will cross some thresholds. There are two thresholds, the "All Clear" threshold and the "Warning" threshold. These thresholds can be configured with the command CONF_BACKUP_RECORDING_STATUS_MSG_THRESHOLD (see rcp documentation). Another reason for sending this message will be on deleting or overwriting of records, which had to be backuped but weren't backuped before deletion, or were deleted while still within the maximum retention time range. Every time this event happens, the lost counter will be incremented. This counter will count since device boot.

CONF_BACKUP_RECORDING_STATUS_MSG_THRESHOLD

Tag code	NumDes	Message	SNMP Support
0x0bb5	line (1 ...n)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_user	get the thresholds, see detailed description
Write	p_octet	access_right_service	set the thresholds, see detailed description

Payload Structure

all clear threshold

threshold for all clear in percent

warning threshold

threshold for warning in percent

CONF_BACKUP_RECORDING_STATUS_MSG_THRESHOLD

This command configures the thresholds for the CONF_BACKUP_RECORDING_STATUS message. The message will be send, when the storage space utilization will cross the "all clear" threshold by changed utilization from higher to lower utilization or when crossing the "warning" threshold by changed utilization from lower to higher utilization.

CONF_BUFFERED_RECORDING_MODE

Tag	code	NumDes	Message	SNMP Support
	0x0bcd	no	no	no
	Datatype	Access Level	Description	
Read	t_octet	access_right_user	get the buffered recording mode: 0 off, 1 on	
Write	t_octet	access_right_service	set the buffered recording mode: 0 off, 1 on,	

Payload Structure

Buffered Rec Mode
1 OCTET

8

Buffered Rec Mode

manual configuration	0
buffered recording configuration mode	1

CONF_BUFFERED_RECORDING_MODE

This command can be used to configure the buffered recording configuration mode. The default is the manual mode, which is used for standard (single/dual) recording or manually configured buffered recording, which means the primary and secondary recording will be setup to do buffered recording. In case of buffered recording configuration mode, the device recording configuration will be changed internally to an buffered recording setup. The recording will then be configured like a single primary recording via recording profiles but internally the configuration is mapped to a coresponding buffered recording setup. When set to this mode, the secondary recording isn't accessable anymore via recording profile configuration (affected comands: CONF_HD_RECORD_PROFILE, CONF_HD_RECORD_PROFILE_V2, CONF_HD_RECORD_PROFILE_SECONDARY, CONF_HD_PROFILE_V2_SECONDARY) and start/stop configuration(affected commands: CONF_START_RECORD, CONF_START_SPAN_RECORD, CONF_HD_MGR_START, CONF_HD_MGR_START_SECONDARY, CONF_HD_MGR_STOP, CONF_HD_MGR_STOP_SECONDARY). When the mode is changed, the actual recording is stopped.

CONF_WPS_BUTTON_ENABLED

Tag code		NumDes	Message	SNMP Support
0x0be8		no	no	no
Datatype		Access Level	Description	
Read	flag	access_right_user	Returns if the WPS button is enabled (1) or not (0). Default is enabled.	
Write	flag	access_right_service	Enables or disabled the WPS button. When the button is disabled, pressing the button has no effect.

CONF_HD_REPLAY_START

Tag code		NumDes	Message	SNMP Support
0x0902		no	yes	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	returns t_int parameter in percent of realtime replay (default +100%); 0 if suspended or stopped; Session ID is needed	
Write	t_int	access_right_user	start a HD replay at the current position; t_int parameter in percent of realtime replay (default +100%); negative values will result in a reverse replay; Session ID is needed	

CONF_HD_REPLAY_START_EX

Tag code		NumDes	Message	SNMP Support
0x0c74		no	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	not supported, use CONF_HD_REPLAY_START	
Write	p_octet	access_right_user	start a HD replay at the current position; 32 bytes: 4Bytes int parameter in percent of realtime replay (default +100%); negative values will result in a reverse replay; 1byte flags, 1 byte cseq, remaining reserved, Session ID is needed	

CONF_HD_REPLAY_STOP

Tag code		NumDes	Message	SNMP Support
0x0903		no	yes	no
Datatype		Access Level	Description	
Read	flag	access_right_minimal	1=replay is stopped; 0=replay is in progress	
Write	flag	access_right_user	stop a current HD replay; replay pointer will not be affected; Session ID is needed	

CONF_HD_REPLAY_STOP_TIME

Tag code	NumDes	Message	SNMP Support
0x0904	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_user	see detailed description

Payload Structure

Seconds

Absolute time in seconds since 1.1.2000 00:00h.

This command will return a write error if the timeposition is outside a recording set. The Session ID is needed. A value of zero clears the stop marker.

CONF_HD_REPLAY_SEEK_TIME

Tag	code	NumDes	Message	SNMP Support
	0x0905	no	yes (every second)	no
	Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description	
Write	p_octet	access_right_user	see detailed description	

Payload Structure

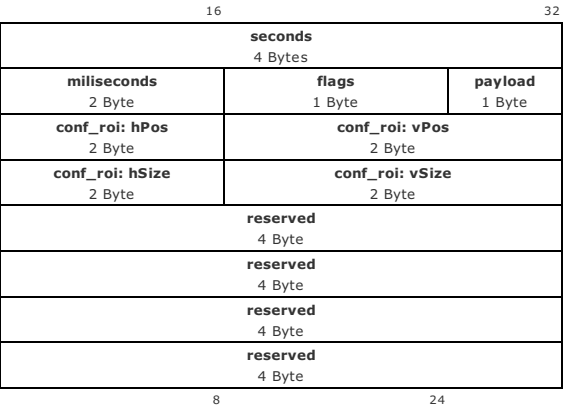

Seconds

Absolute time in seconds since 1.1.2000 00:00h.

Rtp Timestamp

Only in message. Rtp timestamp of the first replayed RTP packet of this second.

extended payload Structure (optional, instead of above payload structure; for write direction only)

seconds

Absolute time in seconds since 1.1.2000 00:00h.

milliseconds

milliseconds

flags

Values:		
Bit 0	Time Zone	payload contains the timezone as quarter hours offset (signed char)
Bit 1	Iframe Preview	sends the Iframe on the seek position (transcoder case only)
Bit 2	Sec Accuracy	seek time accuracy to seconds (transcoder case only)

payload

one payload byte, conntend depends on the flags field

conf_roi

select region of interest hPos,vPos,hSize,vSize (each entry 2 bytes): starting left upper edge, each 2bytes 0..32768, vSize==0 means keep aspect ratio

This command will return a write error if the timeposition is outside a recording set. The Session ID is needed.

CONF_HD_REPLAY_SEEK_IFRAME

Tag code		NumDes	Message	SNMP Support
0x0907		no	no	no
Datatype		Access Level	Description	
Read	t_int	access_right_minimal	obsolete	
Write	t_int	access_right_user	set the replay pointer to the beginning of the next frame/last I-Frame(s); parameter t_int -1 back to last iframe, 1 to next frame; Session ID is needed	

CONF_HD_REPLAY_EVENT_INFO

Tag code	NumDes	Message	SNMP Support
0x091f	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_user	read only

This command returns a list of recorded alarm events in backward order, since fw 4.0 events are only alarm state changes. Max size of the list is 128 entries. The command needs a valid replay session. The events start from the given end time (first 4 bytes of payload) in seconds since 2000. If the payload consists of at least 8 bytes and the bytes 5-8 are filled with the value 0xeeeeeeee the extended event structure is used in the response payload. Payload size with all optional parameters is 12 bytes (see "In Payload"). The response contains a flag field, containing the alarm flags, which give information about the alarm, which are activated at this event or if all alarms went to off state, if no one of the alarm flags were set. the flags also contains the time zone information with sign and number of quarter hours.

In Payload

16	32
search begin time	
4 Bytes	
special field	
4 Bytes	
earliest time	
4 Bytes

8	24

Extended Event Structure

16			32
Upper X 1 Byte	Upper Y 1 Byte	Lower X 1 Byte	Lower Y 1 Byte
Event Time in secs 4 Bytes			
residual milliseconds 2 Bytes		reserved 2 Bytes	
Flags 4 Bytes			
8		24	

search begin time

Start time of the search in seconds since 2000. The search will proceed into the past.

special field

Optional parameter, if set to 0xeeeeeeee, the reply will contain data in extended event structure format. Any other value has no meaning yet.

earliest time

Optional parameter, Erliest time in seconds since 2000. The search won't search in record files, which lie before that time. The search will be performed on file which lie completely or partially within the search interval of earliest time and search begin time. If not set, the default will be 0.

Event Time

Seconds since 2000.

Flags

Values:

Bit 0 Motion Alarm

Bit 1	Input Alarm
Bit 2	Video Loss
Bit 3	Virtual alarm (see CONF_VIRTUAL_ALARM_STATE)
Bit 24 - 30	time zone quarter hours (mask: 0x7f000000)
Bit 31	time zone quarter hours sign (1 - negativ)

Upper X,Y and Lower X,Y

Specifies a bounding box (upper left corner and lower right corner). If an object can be associated with the alarm then the bounding box will be around this object otherwise the whole image is the bounding box. The values are normalized to the image size and are between 0 and 255. The origin of the coordinate system is the upper left corner of the image.

CONF_HD_REPLAY_PARTITION_EVENT_INFO

Tag code		NumDes	Message	SNMP Support

Write	t_dword	access_right_user	requested vcd config 0=all data, 1=config1 data ,2=config2 data,...; replay session id required	

CONF_HD_REPLAY_FORENSIC_SEARCH_SETUP

Tag code	NumDes	Message	SNMP Support
0x0b0a	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	setup a forensic search
Write	p_octet	access_right_user	setup a forensic search, see detailed description

This command is related to a replay session. The replay session will start a forensic search with the provided ruleengine script. The return payload consists of a unique 4 byte ForensicSearch ID which can be refound in the corresponding message (HD_REPLAY_FORENSIC_SEARCH_RESULT). In the case of an error the RCP_ERROR_COMMAND_SPECIFIC error is returned with an error code (see HD_REPLAY_FORENSIC_SEARCH_RESULT) followed by an additional text.

Error Response Structure

RCP_ERROR_COMMAND_SPECIFIC	Error type	Error text
1 Byte	1 Byte	n Byte

Error type

Name	Value
e_ForensicSearchErrorNone	0x00
e_ForensicSearchErrorScriptTooLong	0x01
e_ForensicSearchErrorInternal	0x02
e_ForensicSearchErrorNoRuleSelected	0x03
e_ForensicSearchErrorREConfiguration	0x04
e_ForensicSearchErrorSyntax	0x05
e_ForensicSearchErrorMemory	0x06

Error text

The error text is a detailed description of the error. E.g. for syntax errors the line of the script and error type are mentioned.

Payload Structure

16			32
Begin [s] 4 Byte			
End [s] 4 Byte			
reserved 4 Byte			
Script length 2 Byte		Script mode 1 Byte	VCA Profile ID 1 Byte
Layer Mode 1 Byte	Flags 1 Byte	Layer mask 2 Byte	
Ruleengine script script length			
...			
8		24	

Begin[s]

Defines begin of forensic search in seconds since 2000 (local time).

End[s]

Defines end of forensic search in seconds since 2000 (local time).

reserved

This value should be set to zero.

Script length

Length of the script. If the length of the script is zero a default search is performed, i.e. "Detect any object or Detect any Flow or Detect any Motion".

Script mode

The mode defines how the configuration data has to interpreted. See detailed description of configuration data for each case below.

- Mode 0x0Rule engine configuration
- Mode 0x1Rule engine script only
- Mode 0x2In field search
- Mode 0x3Crossing line search

VCA Profile ID

VCA profile id search is supported. The recommended profile id is zero resulting in an exhausting search over the given interval. With a non zero profile id the searh speed can be increased because meta data recorded with different a profile are skipped.

Layer Mode

The recommended layer mode value is 0. In this case the layer mask is ignored and the default layers are used. If 1 then the user defined layer mask, see below, is used. The main purpose for the layer mode is for debugging.

Flags

0x01	Flag Send:	Send layer data
0x02	Flag Verbose:	Additional printouts
0x04	Flag Cache Data:	Collects compressed VCD data, next search will use collected VCD packets
0x08	Flag Clear Cache:	Collected VCD packets will be deleted, next search will start new replay

Layer Mask

The layer mask is only used if layer mode is set to 1.

Configuration data

The script mode defines how this data has to be interpreted.

Rule engine configuration

In this mode the configuration data contains the whole rule engine configuration (eg including camera calibration). For more detailed information see the rcp command: CONF_VCD_OPERATOR_PARAMS.

Rule engine script only

If the script mode is selected to "rule engine script only" the configuration data contains the rule engine script. The script is encoded in plain text. One of these examples can be used as a valid script.

Example 1 ("Any motion/flow/object in Field"):
Field #1 := { Point(50, 50) Point(100, 50) Point(100, 100) Point(50, 100) };
FlowDetector #1 := { Field #1 };
MotionDetector #1 := { Field #1 };
external SimpleState #1 := DetectedFlow #1;
external SimpleState #2 := DetectedMotion #1;
external ObjectState #3 := InsideField #1;

Example 2 ("Object in Field"):
Field #1 := { Point(50, 50) Point(100, 50) Point(100, 100) Point(50, 100) };
external ObjectState #1 := InsideField #1;
external Event #2 := OnSet ObjectState #1;

Example 3 ("Crossing Line"):
Resolution := { Min(-1,-1) Max(1,1) };
Line #1 := { Point(-0.5, -0.5) Point(0.5, 0.5) DebounceTime(0.50) Direction(1) };
external Event#2 := { CrossedLine #1 };

Example 4 ("Following Route")
Route #2 := { Point(41, 117) Distance(5) Point(51, 87) Distance(9) Point(79, 74) Distance(5) Direction(1) MinPercentage(80) MaxGap(10) };
external Event #3 := { FollowedRoute #2 };

For more details, read the Bosch Query Language Specification.

In field search

A field search is define by two normalized points. Each point is normalized between 0 and 65535. The upper left corner of the image has the coordinates (0,0) and the lower right corner (65535,65535). Additionally, debounce time and intersection mode can be addressed.

1632	
Upper left x-coordinate 2 Byte	Upper left y-coordinate 2 Byte
Lower right x-coordinate 2 Byte	Lower right y-coordinate 2 Byte
Debounce time 2 Byte	Field flags 2 Byte
8	24

Debounce time

The debounce time is given in units of 10 ms.

Field flags

0x01	Object mode:	BaryCenter (0, default) or Boundingbox (1)
0x02	Field mode:	Intersection (o, default) or Covering (1)

Line crossing search

A line crossing search is define by two normalized points. Each point is normalized between 0 and 65535. The upper left corner of the image has the coordinates (0,0) and the lower right corner (65535,65535).

Upper left x-coordinate 2 Byte	Upper left y-coordinate 2 Byte	
Lower right x-coordinate 2 Byte	Lower right y-coordinate 2 Byte	
Debounce time 2 Byte	Direction 1 Byte	Reserved 1 Byte

824

Debounce time

The debounce time is given in units of 10 ms.

Direction

One can choose whether any object which passes the line triggers an event or whether only objects which pass from left to right respectively right to left are relevant:

- 0 any object which passes the line triggers an event
- 1 whether only objects which pass from left to right triggers an event
- 2 whether only objects which pass from right to left triggers an event

CONF_HD_REPLAY_FORENSIC_SEARCH_CANCEL

Tag code	NumDes	Message	SNMP Support
0x0b50	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	-
Write	t_dword	access_right_user	cancel a forensic search, t_dword is the search id (result of search setup), session id is required

CONF_HD_REPLAY_FORENSIC_SEARCH_RESULT

Tag code	NumDes	Message	SNMP Support
0x0b0b	no	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	results of a forensic search (msg only)
Write	p_octet	access_right_user	results of a forensic search (msg only), see detailed description

This command is a messages command. It successively delivers the results of a forensic search request.

Payload Structure

			32
Forensic Search ID			
4 Byte			
Sequence Number	Nbr of Evts (n)	Last Message	
2 Byte	1 Byte	1 Byte	
Progress Time			
4 Byte			
Timezone	Event type	Reserved	
1 Byte	1 Byte	2 Byte	
n Forensic Search Events			
n * m byte			
8		24	

Forensic Search ID

With the forensic search ID this event message can be assigned to the corresponding search request.

Sequence Number

The sequence number is increasing and missing packets can be detected.

Last Message

The last message byte is signalling that the search has been accomplished with this message.

Progress Time

This time informs about the progress of the search. The time is given in seconds since 1-1-2000 (local time). This time is updated every second (search time) and forces to throw this message. Hence, it can be expected that at least every second a message will be thrown.

Timezone

Timezone in quarter hours (signed byte in two's complement representation).

Event type

Different events can be sent by this message. Error messages include only one event per message.

Object Event	0x00
Error Event	0x01

8		24	

Begin

The beginning of the event is provided in local time in seconds since 2000 and milliseconds.

Duration

Duration of the event in ms.

Rule ID

The Rule ID informs which rule is related to this event.

Object ID

Object ID which has caused the alarm.

Bounding Box

Bounding box of object in normalized coordinates from 0 to 255. First, the upper left point is encoded then the lower right point of the bounding box. The coordinate (0,0) is the upper left corner of the image and the point (255,255) is the lower right corner of teh image. The bounding box is from the begin time.

Error Event

Error type	Error text
1 Byte	64 Byte

Error types

Name	Value
e_ForensicSearchErrorNone	0x00
e_ForensicSearchErrorInternal	0x02
e_ForensicSearchErrorNoMetaData	0x07
e_ForensicSearchErrorDataDoesNotMatch	0x08

Error text

The error text is a detailed description of the error. E.g. for syntax errors the line of the script and error type are mentioned.

CONF_HD_REPLAY_PREFETCH_JPEGS

Tag code		NumDes	Message	SNMP Support
0x0b55		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	write only	
Write	p_octet	access_right_user	sessionID required, 16bytes header (1byte jpeg quality 0-100, 1byte reserved, 2bytes jpeg height in pixel, 12bytes reserved), N times seconds_since_2000 (each 4bytes)	

CONF_HD_REPLAY_CUSTOM_SETTINGS

Tag code	NumDes	Message	SNMP Support
0x0b56	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read replay custom settings, see detailed,
Write	p_octet	access_right_user	set replay custom settings, see detailed,

Payload Structure

16	32
flags	
32 Bits	
flags mask	
32 Bits	
kbps max	
32 Bits	
time shift	
32 Bits	
8	24

flags

flag field for configuring custom behavior of an replay session

Values:

patch rtp hdr	0x00000001
dont send dummy pkt	0x00000002
h264 only	0x00000004
auto start	0x00000008
no rcp message	0x00000010
set kbps max	0x00000020
L16 to G711	0x00000040
use UTC	0x00000080
add rtp hdr extension	0x00000100
patch pic id	0x00000200
set time shift	0x00000400
transcode	0x00000800
ignore start and end of files	0x00001000
aac 16 khz rtp clock	0x00002000

flags mask

mask for the flag field, it is used to set only choosen values without changing the other values. To set a choosen value in the flag field, the corresponding flag in the flags mask has to be set also. All other setting will be left unchanged

kbps max

set the max send data rate in kbit per seconds, "set kbps max" flag has to be set in order to change that value.

time shift

set time shift in seconds, "set time shift" flag has to be set in order to change that value.

CONF_HD_REPLAY_CUSTOM_SETTINGS

This command is used to configure the behaviour of an existing replay session. A valid replay session id has to be provided.

CONF_HD_REPLAY_CERTIFICATES_LIST

Tag code	NumDes	Message	SNMP Support
0x0c12	no	no	no

-------	---

List Len

Size of the certificates list in response payload in bytes

Certificates List (sequence of)

Timestamp

Local time in seconds since 2000

TZ QH

Timezone offset (from utc) in quarter hours as signed char value

Length

Length of the Certificates List Entry (certificate including these 8 bytes header infos)

Certificate

One certificate

CONF_HD_REPLAY_CERTIFICATES_LIST

This command can be used to query the certificates from the records of a camera via replay session (session ID required), in order to verify the signed video record data within that records. The response will deliver all certificates of the records and time intervall addressed by the specidified replay session. The maximum size of the response can be limited by the caller but it will not exceed 16 kb for the certificates list. If the response payload size isnt't enough to hold all valid certificates, a flag in the response will signal the existence of further certificates, which didn't fit in the response payload. A second query in that case with a smaller time interval may help to get the remaining certificates. The response will have a certificates list with several enries of different size, there are no gaps between the entries.

CONF_HD_REPLAY_SEQUENCE_VERIFY

Tag code		NumDes	Message	SNMP Support
0x0c23		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	verifies authenticity of the replayed video records if enabled, reads the enabled verification flags: 0x1 - hash verify, 0x2 - signature verify, 0x4 - certificate verify	
Write	t_dword	access_right_user	verifies authenticity of the replayed video records if enabled, sets the enabled verification flags: 0x1 - hash verify, 0x2 - signature verify, 0x4 - certificate verify

remoteCamera	transcode	transcoderPreset	reserved
1 Byte	1 Byte	1 Byte	1 Byte
replaySpeed			
4 Bytes			
objectID			
4 Bytes			
reserved			
4 Bytes			
backup filename			
16 Bytes			
flags	signature hash type	reserved	
1 Byte	1 Byte	2 Bytes	

From2000

Start time of the backup in seconds since 2000

To2000

Stop time of the backup in seconds since 2000

account

index of the account that should be used for backup (see CONF_ACCOUNT_SETTINGS), special account dummy backup 0xff.

recordingIndex

index of the recording to be backuped (0 or 1)

remoteCamera

0 - local Camera, 1 to 4 refering to entries of CONF_ADD_REMOTE_DEVICE

transcode

optional field that defines if the video should be transcoded before backup (used by Transcoder Devices only)

transcoderPreset

optional field that defines the preset used by transcoding (used by Transcoder Devices only)

replaySpeed

optional field that defines the replay speed (used by Transcoder Devices only). Use the same values as for CONF_HD_REPLAY_START

objectID

optional field: if that Id is given a autotracker instance will be started that follows the object (used by Transcoder Devices only)

reserved

reserved for future use

filename

backup filename: filename in arbitrary order of: %b begin date/time, %e end date/time, %c camera name, %i export job id, %f file nbr, %a alarm description, %dSubDirectory sub directory to write; optionally seperated by "_" or "-". Exampe: %b_%c would result e.g in a filename 20111017_14-29-26_camera1.mp4

flags

Flags:

CHECK_SIGNATURE	0x01	checks the signature of the source records, the generation of a signature of the backup will fail, if the check fails
AUTH_MSG_ADDON	0x02	Status message CONF_BACKUP_STATUS will contain a message addon containing authenticity check result information

signature hash type

activates the generation of a signature file using the https certificate, works for ftp and dropbox backup

Types:

NO_SIGNATURE	0	signature generation disabled
SHA1	1	generates as signature file over the backup file using SHA1 hash
SHA256	2	generates as signature file over the backup file using SHA256

CONF_BACKUP

starts an mp4 backup file of the specified replay range and store it on a account. The CONF_BACKUP_STATUS message is sent periodically to inform about the backup progress. The command returns an 1 byte backup id that can be used to identify the backup in the message. The backup may include signature generation and video authenticity checks. The check results can be return by an optional addon in CONF_BACKUP_STATUS message. The backup destination can be a dummy backup, the data won't be stored anywhere in that case. The dummy backup is used on the special account number 0xff (255). This is usefull, if the backup is just just for authenticity check of records.

CONF_BACKUP_MAX_KBPS

Tag code		NumDes	Message	SNMP Support
0x0af5		account number (1...4) or 0 for http backup	no	no
Datatype		Access Level	Description

8

24

Backup ID

Backup Session ID

RCP Session ID

corresponding RCP Session ID

Start Time

Start Time of the Backup in Seconds since 2000

End Time

End Time of the Backup in Seconds since 2000

Current Time

the current Time of the backup

Transferred Bytes

transferred bytes

File Count

number of files to backup

File Nbr

Current file to backup

File part

if a larger Backup file is split into multiple parts this value tells the current part

reserved

reserved

Ppm Current File

status in ppm of the current backup

Backup errors

backup errors: The following errors are defined:

Error during backup	0x02
Backup canceled	0x04
Start of backup failed	0x05

RTP packet loss

number of lost packets

MP4 box errors

errors in the mp4 converter.

Account error

The last Account error. The following errors are defined:

NO_ERROR	0x00
NO_IP	0x01
CONNECT_FAILED	0x02
SETDIR_FAILED	0x03
WRITE_FAILED	0x04

Cam

camera

RecIdx

Recording Index

account

the index of the account used for backup (see CONF_ACCOUNT_SETTINGS and CONF_BACKUP). For backup via http the account is set to 0.

backup ID

the backup id that is returned by the CONF_BACKUP command. This id can be used to link the backup started by CONF_BACKUP with this status message

timezone quarter hours

signed time zone offset in quarter hours

link

a direct link to the backup mp file. The message contains the link if it is available

This command is also send as message by an running backup with same payload and an optional addon containing authenticity informations if the check for it and the addon was activated in the backup job:

Payload Structure MSG

16	32

Datatype		Access Level	Description	
Read	t_dword	access_right_service	obsolete	
Write	t_dword	access_right_service	obsolete	

CONF_FORMAT_FS_STATUS

Tag code	NumDes	Message	SNMP Support
0x09d1	yes (file system nr, 1 - recording storage device, 2 - RAMDISK)	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	status and progress of a running format requested by CONF_FORMAT_FS
Write	p_octet	access_right_minimal	status and progress of a running format requested by CONF_FORMAT_FS, see detailed description

Payload Structure

step

Which step of the formatting (FAT32 Formatting including creating recording files or copy replay tools)

Values:

HD_STEP_FORMAT_FS	0x00
HD_STEP_COPY_TOOLKIT	0x01

status

reports the state of formatting. The format can be in state of running, failed or successfully finished. The last one is divided in the two states of HD_FORMAT_STATUS_FINISHED which means FAT32 including recording files and replay tools were created and HD_FORMAT_STATUS_SKIPPED which means that only the FAT32 was created because the storage device was not the needed size for recording.

Values:

HD_FORMAT_STATUS_FAILED	0xff
HD_FORMAT_STATUS_RUNNING	0x00
HD_FORMAT_STATUS_SKIPPED	0x01
HD_FORMAT_STATUS_FINISHED	0x02

progress

value from 0 to 100 represent the progress of the format including copy replay tools in percent.

Values:

progress in percent	0 to 100
---------------------	----------

CONF_FORMAT_FS_STATUS

the message reports the status and progress of a running format. The formatting takes two steps that is first formatting FAT32 including creating the recording files and second copy the replay tools. The progress is reported about the whole formatting. The status reports the state of each formatting step. A successful format should always end with a message with 100 percent progress, step should be copy toolkit and status should be HD_FORMAT_STATUS_FINISHED or HD_FORMAT_STATUS_SKIPPED if the storage device is too small for recording (e.g. RAMDISK). A failed format should finish with a status HD_FORMAT_STATUS_FAILED at any progress and step. After this final messages no further message will follow.

CONF_FORMAT_FS_SPAN

Tag code	NumDes	Message	SNMP Support
0x09e6	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	format the lun into spans.
Write	p_octet	access_right_service	format the lun into spans. (not allowed while recording on this lun)

Payload Structure

Server IP

The iSCSI server ip address

Values:	
Local connected USB disk	ff.ff.ff.ff
iSCSI Server	valid ip address

Target IDX

Index of the iSCSI server target. The index of the desired target can be obtained from the reply to an iSCSI discover.

Lun IDX

Index of the lun of the specified target.

Span Cnt

Number of spans the lun shall be formatted with

Span Size

Size of each span in megabyte. (1 MB = 1024 x 1024 Bytes)

Flags

these flags are optional, if no flags are set (default), no span format will be executed

REPAIR_FS (repair file system without clearing spans)	0x01
CLEAR_SPANS_ONLY (only clear the spans)	0x02

Note

The reply packet will contain the values of the actually formatted spans and size. If the product of the span count and the span size in the request packet exceeds the size of the current lun, only as many as possible spans are formatted. If the product is less than the available lun space, the back part of the lun will be unused. Size of the write payload is at least 12 bytes, if the optional flags are used the payload has to be at least 16 bytes.

Specific Error Types

SPAN_ERR_INTERNAL	0x01
SPAN_ERR_NOT_MNTD	0x05
SPAN_ERR_INV_FS	0x06
SPAN_ERR_INV_LUN_NFO	0x07
SPAN_ERR_RD_ONLY	0x0a
SPAN_ERROR_OLD_LUN_NFO	0x20
ISCSI_ERROR_CONNECT	0x31
ISCSI_ERROR_INV_LUN	0x33
ISCSI_ERROR_LOGIN	0x34
ISCSI_ERROR_INV_TRG_IDX	0x35

Note: A list of all defined error types can be found in the Appendix.

CONF_FORMAT_FS_SPANS_STATUS

Tag code	NumDes	Message	SNMP Support
0x09f5	no	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	status and progress of a running format requested by CONF_FORMAT_FS_SPANS, see detailed description
Write	p_octet	access_right_service	status and progress of a running format requested by CONF_FORMAT_FS_SPANS, see detailed description

Payload Structure

		16	32
step 1 Byte	status 1 Byte	progress 2 Byte	
ip 4 Bytes			
target_idx 1 Byte	lun 1 Byte	reserved 2 Byte	
8		24	

step

Which step of the formatting (FAT32 Formatting including creating spans and clearing span headers)

Values:	
HD_STEP_FORMAT_FS	0x00
HD_STEP_CLEAR_SPAN_HEADER	0x02

status

reports the state of formatting. The format can be in state of running, failed or successfully finished. success means the creation of the fat32 file system and the empty spans or clearing the span headers was successfully.

Values:	
HD_FORMAT_STATUS_FAILED	0xff
HD_FORMAT_STATUS_RUNNING	0x00
HD_FORMAT_STATUS_FINISHED	0x02
HD_FORMAT_ERASE_DISK	0x03

progress

value from 0 to 100 represent the progress of the format including the creation of the empty recording spans and clearing the header files.

Values:	
progress in percent	0 to 100

ip

ip of the storage device or lun, that is formatting

target_idx

Target Index of the storage device from 0 to 255.

lun

Lun of the storage device from 0 to max. 255.

reserved

2 Bytes reserved

CONF_FORMAT_FS_SPANS_STATUS

this message reports the status and progress of a running format. The formatting includes the creation of the FAT32 file system (step: HD_STEP_FORMAT_FS) and clearing of the span header files(step: HD_STEP_CLEAR_SPAN_HEADER). The progress is reported about the whole formatting. A successful format should always end with a message with 100 percent progress at step HD_STEP_CLEAR_SPAN_HEADER and status should be HD_FORMAT_STATUS_FINISHED. A failed format should finish with a status HD_FORMAT_STATUS_FAILED at any progress and any step. After these final messages no futher messages will follow. The whole formatting takes two steps HD_STEP_FORMAT_FS and HD_STEP_CLEAR_SPAN_HEADER. First step HD_STEP_FORMAT_FS will run up to 90 percent and will end with a 90 percent progress message and status HD_FORMAT_STATUS_FINISHED if successful. Then the last step HD_STEP_CLEAR_SPAN_HEADER will follow from 90 to 100 percent and will also end with a HD_FORMAT_STATUS_FINISHED status if successfull, which is also as mentioned earlier the final success message. If the formatting runs with the option of disk erasing, The first step will be the HD_STEP_ERASE_DISK step and will run upto 70 percent if successful.

CONF_SPAN_ADDRESS_LIST

Tag code	NumDes	Message	SNMP Support
0x09e7	yes (1 - primary spanlist, 2 - secondary spanlist)	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	See detailed description.
Write	p_octet	access_right_service	See detailed description.

Payload Structure

Span Address 1 - n

For the structure of a span address so description below.

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target IDX

Index of the iSCSI server target. The index of the desired target can be obtained from the reply to an iSCSI discover.

Lun IDX

Index of the lun of the specified target.

Span IDX

Index of the span in the specified lun.

Write request

On a write request, a list of max n (n=512) span addresses must be supplied. List entries that are zero are not used by the unit for recording. The unit uses the supplied ordering of the list and begins with the first entry. The order of the supplied list is the preferred order, not the guaranteed order. There are some cases, in which the device changes the use order (e.g. one target not reachable).

If the device is already recording on spans (a span list is already present on the device), the new list must contain the span addresses, that the unit is currently recording on. The latter information can be obtained by reading the current span address list form the unit and check the corresponding write lock header (if the units IP and MAC address is found this means the unit is recording). If the unit receives a list and the span addresses of the spans the device is currently recording on is not present, the list is rejected (not saved in the configuration) and an error is returned

Read Request

The reply to an read request always contains up to n (n=512) entries. The response in case of an empty span list is one zeroed span entry.

Message

A message of this cmd tag will be send always, if somone sets the span address lists by using rcp set spans list commands or if the span list is cleared by indirectly by changing other settings of the device (e.g. rec mgmt).

Specific Error Types

SPAN_ERR_INTERNAL	0x01
SPAN_ERR_INV_ADDR_LIST	0x04

Note: A list of all defined error types can be found in the Appendix.

CONF_SPAN_ADDRESS_LIST_NEW

Tag code	NumDes	Message	SNMP Support
0x0a52	yes (1 - primary spanlist, 2 - secondary spanlist)	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	See detailed description of CONF_SPAN_ADDRESS_LIST
Write	p_octet	access_right_service	See detailed description of CONF_SPAN_ADDRESS_LIST (no need to include mounted spans in list)

CONF_SPAN_HDR_ACCESS

Tag code	NumDes	Message	SNMP Support
0x09e8	yes	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	Access span header information.
Write	p_octet	access_right_service	Access span header information.

Payload Structure

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Values:

Local connected USB disk	ff.ff.ff.ff
iSCSI Server	Valid IP address

Target IDX

Index of the iSCSI server target. The index of the desired target can be obtained from the reply to an iSCSI discover.

Lun IDX

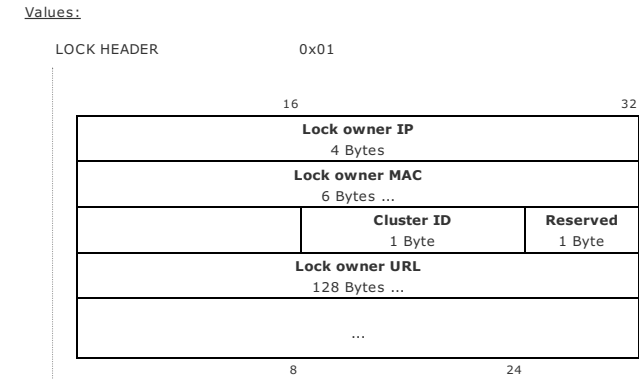

Index of the lun of the specified target.

Span IDX

Index of the span in the specified lun.

Span Header

Data of the span header. Length and structure differs for the specified header type. The header type is specified with the numeric descriptor:

Lock owner IP

IP address of the unit that holds the write lock of the span.

Lock owner MAC

Hardware address of the unit that holds the write lock of the span

Cluster Id

Cluster id of the recorder 1 - n, default value is 0 if not set, should be treated as cluster id 1

Lock owner URL

url (ipv4 or ipv6) of the unit that holds the write lock of the span

NOTE:

In the request packet, the header values are ignored (may be zero). The reply contains the values read or written.

On write requests, the local IPv4 and MAC addresses are converted to ascii strings

and written to the file LCKxxxxx.txt (xxxx = span index) on disk. On read requests, the ascii strings of that file are scanned into binary values and send with the reply.

MANAGER HEADER 0x02

16	32
Manager Header Data N Bytes (max. 1024) ...	
8	24

Manager Header Data

Transparent header data of the storage manager

The reply always returns the 1024 Bytes of the manager header file MGRxxxx.txt (xxxx = span index).

UNIT HEADER 0x03

16

32

Span owner IP 4 Bytes			
Span owner MAC 6 Bytes ...			
		Span owner Camera 2 Byte	
Retention Time 4 Bytes			
Modification seal random 4 Bytes			
Modification seal time 4 Bytes			
Recording 1 Byte	Cluster ID 1 Byte	encryption 1 Byte	reserved 1 Byte
Max Retention Time 4 Bytes			
Span owner URL 128 Bytes ...			
...			
Modification MAC 6 Bytes ...			
		reserved 2 Byte	
User Data 16 Bytes ...			
...			
GUID 32 Bytes ...			
...			

8

24

Span owner IP

IP address of the unit that holds the write lock of the span.

Span owner MAC

Hardware address of the unit that holds the write lock of the span

Span owner Camera

The index of the camera the unit uses for recording.

Retention Time

Retention Time for the recordings on this span in sec since 2000

Modification seal random

random number set on the last modifacation of this span, this random will be set on each write access on any span header or on starting or stopping a recording of a device on this span, there will be also updates while a device is recording in a period of several minutes

Modification seal time

this information is the time of the last modification on this span that causes a modification seal update

Recording

for dual recording, 1 - primary recording, 2 - secondary recording, if this value is not set then default is primary recording

Cluster Id

Cluster id of the recorder 1 - n, default value is 0 if not set, should be treated as cluster id 1

encryption

encryption of the span, 0 - unknown (check record file for keys, will be ignored for write direction), 1 - no encryption, 2 - xts encrypted

Max Retention Time

Max Retention Time for the recordings on this span in sec since 2000, 0 means no max retention time

Span owner URL

url (ipv4 or ipv6) of the unit that used the span

Modification MAC

Hardware address of the instance, which modifies the unit header (must be non zero for write direction)

User Data

byte field for any user data (16 bytes)

GUID

GUID (managed by vrm) of the device which recorded on this span (32 bytes)

NOTE:

In the read request packet, the header values are ignored (may be zero). In the write request packet, only the camera field is evaluated, the values for IP and MAC are taken from local configuration. The reply packet contains the values read or written.

On write requests, the local IPv4 and MAC addresses and the supplied camera value are converted to ascii strings and written to the file UNTxxxx.txt (xxxx = span index) on disk. On read requests, the ascii strings of that file are scanned into binary values and send with the reply.

The modification seal values cannot be set by this command as write request directly, they will be set automatically on span header write requests or on starting or stopping a recording. The content of this fields will be ignored in a write request.

Specific Error Types:

SPAN_ERR_INTERNAL	0x01
SPAN_ERR_INV_SPN_IDX	0x02
SPAN_ERR_INV_HDR_TYPE	0x03
SPAN_ERR_NOT_MNTD	0x05
SPAN_ERR_INV_FS	0x06
SPAN_ERR_INV_LUN_NFO	0x07
SPAN_ERR_BAD_HDR_CKSM	0x08
SPAN_ERR_RD_ONLY	0x0a
ISCSI_ERROR_CONNECT	0x31
ISCSI_ERROR_INV_LUN	0x33
ISCSI_ERROR_LOGIN	0x34
ISCSI_ERROR_INV_TRG_IDX	0x35

Note: A list of all defined error types can be found in the Appendix.

CONF_START_SPAN_RECORD

Tag code	NumDes	Message	SNMP Support
0x09f7	yes (1 - primary recording, 2 - secondary recording)	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	obsolete, please use CONF_START_RECORD instead
Write	p_octet	access_right_service	obsolete, please use CONF_START_RECORD instead

CONF_SPAN_PARTITION_PROP

Tag code	NumDes	Message	SNMP Support
0x09fa	yes (camera)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	return partition properties for primary span recording (4 bytes) video type (1 byte: 0= NO, 1=MPEG2, 3=MPEG4), audio type (1 byte: 0= NO, 1=G711, 2=L16, 3=AAC) reserved (2 byte)
Write	p_octet	access_right_service	(obsolete and not supported anymore)

CONF_SPAN_PARTITION_PROP_ALARM

Tag code	NumDes	Message	SNMP Support
0x09fb	yes (camera)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	obsolete and not supported anymore
Write	p_octet	access_right_service	obsolete and not supported anymore

CONF_SPAN_PARTITION_PROP_SECONDARY

Tag code	NumDes	Message	SNMP Support
0x0a4b	yes (camera)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	return partition properties for secondary span recording (4 bytes) video type (1 byte: 0= NO, 1=MPEG2, 3=MPEG4), reserved (3 byte)
Write	p_octet	access_right_service	(obsolete and not supported anymore)

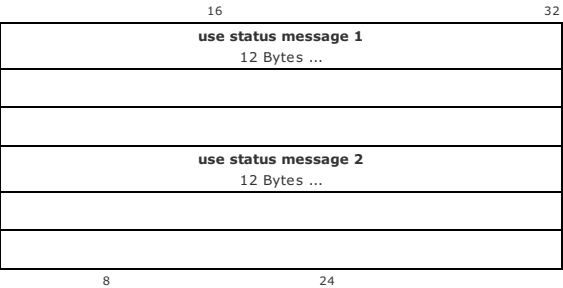

CONF_SPAN_PARTITION_PROP_ALARM_SECONDARY

Tag code	NumDes	Message	SNMP Support
0x0a4c	yes (camera)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	obsolete and not supported anymore
Write	p_octet	access_right_service	obsolete and not supported anymore

CONF_SPAN_USE_STATUS

Tag code	NumDes	Message	SNMP Support
0x09f8	cam	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	usage status of a span, see detailed description
Write	p_octet	access_right_service	not supported

Payload Structure

use status message 1 - 2

Upto 2 span use status messages. If no span is in use by the camera specified by num, the reply payload size will be 0. In case of the rcp message the payload contains always 1 span use status message.

Span Use Status Message Structure

824

error/special code

additional error or status code to the status, for status HD_SPAN_USE_STATUS_ERROR_MOUNT see section "status HD_SPAN_USE_STATUS_ERROR_MOUNT error codes", for status RELEASE and RELEASE_UNUSED see section "status RELEASE error codes", for status MOUNTED see section "status MOUNTED special codes"

status

use status of this span

Values:

MOUNTED	0x00
RELEASE	0x01
RELEASE_UNUSED	0x02
ERROR	0x03
RECORDING	0x04
PENDING_SPAN_REQUEST	0x05
HD_SPAN_USE_STATUS_RETENTION_TIME	0x06
HD_SPAN_USE_STATUS_RELEASE_REMOUNT_INTENDED	0x07
HD_SPAN_USE_STATUS_ERROR_WRT_UNT_HDR	0x10
HD_SPAN_USE_STATUS_ERROR_FORMAT_REC_REGION	0x11
HD_SPAN_USE_STATUS_ERROR_MOUNT	0x12
HD_SPAN_USE_STATUS_ERROR_RETENTION_TIME	0x13

If the status is PENDING_SPAN_REQUEST, the ip will be 255.255.255.255, target index and lun will be 255, and span index will be 65535, which should be interpreted as still unknown, because this cam had requested a span, but it doesn't know yet which span it gets.

Status HD_SPAN_USE_STATUS_RELEASE_REMOUNT_INTENDED means, the cam has released the block but has left the span lock, because it will try to remount the span later. The span is stored in the span history for remount(see CONF_SPAN_HISTORY).

cam

which cammera is or was using the reported span

target_id

target id of the lun (may be the ipv4 address for older versions or with default target resolve

configuration, see CONF_TARGET_ID_RESOLVE_RULES)

target_idx

Target Index of the storage device from 0 to 255.

lun

Lun of the storage device from 0 to max. 255.

span_idx

Index of the span on the storage device.

CONF_SPAN_USE_STATUS

This messages reports the use status of a span for this device and which cammera for primary recording. If a span was opened for a planned recording, this message will be send with status MOUNTED. If the mounting fails status will be ERROR. If a span was closed after recording status will be RELEASE, if it was closed before a recording ever took place, status will be RELEASE_UNUSED. HD_SPAN_USE_STATUS_RETENTION_TIME status will be send as message if the first time an retention time update took place on the span. In case of a read request the reply payload contains this status message upto twice. the command can be used to query the actual used spans from a camera specified by the num parameter. the status for a span can be RECORDING, if the cam is actual recording on this span or MOUNTED, if the span is mounted and prepared for a future recording by this camera.

status HD_SPAN_USE_STATUS_ERROR_MOUNT error codes

<u>Values:</u>		
standard mount		0x00
HD_MOUNT_CODE_REMOUNTED		0x01

CONF_SPAN_USE_STATUS_SECONDARY

Tag code		NumDes	Message	SNMP Support
0x0a4a		cam	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_service	span use status for secondary recording, payload as in CONF_SPAN_USE_STATUS	
Write	p_octet	access_right_service	not supported	

CONF_SPAN_PARTITION_FILE_INFO

Tag code	NumDes	Message	SNMP Support
0x0a2d	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Read the file info of a span.
Write	void	access_right_service	not supported

Payload Structure

Target ID 4 Bytes		
Target IDX 1 Byte	LUN 1 Byte	Span IDX 2 Byte
Start Time (optional) 4 Bytes		
Stop Time (optional) 4 Bytes		
maxEntries (optional) 4 Bytes		
optional flags (optional) 4 Bytes		

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target IDX

Index of the iSCSI server target. The index of the desired target can be obtained from the reply to an iSCSI discover.

LUN

The logical unit.

Span IDX

Index of the span in the specified lun.

Start Time

Seconds since 2000, optional, if missing, default is 0

Stop Time

Seconds since 2000, optional, if missing, default is unlimited

maxEntries

Max Number of entries, optional, if missing, default is max. 256 files which is also the max. limit for this value

optional flags

additional options for the file info

Values:	
add span info flags	0x00000001

Response Structure

For the payload structure of the response see documentation of HD_PARTITION_FILE_INFO. In case of the optional "add span info flag" flag the first four bytes of the responspayload will contain a flag field with additional infos. Without the option, the payload will start with the file info without offset.

Response Payload Structure

optional span info flags 4 Bytes
file info payload n Bytes
...

optional span info flags

additional info of the span

Values:
encrypted span key list

present

0x00000001

CONF_EXPORT_SPAN

Tag code	NumDes	Message	SNMP Support
0x0a2e	no	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Retrieve a span of the devices storage.
Write	p_octet	access_right_service	not supported

Request Payload Structure

Recording Camera
12 Bytes ...
Lun Addr
8 Bytes ...
Reserved
12 Bytes ...
Overwrite Retention Time
4 Bytes
Reserved
4 Bytes
Uri
max. 128 Bytes
...

Recording Camera

The address of the device the span is assigned to.

16	32
IPv4	
4 Bytes	
MAC	
6 Bytes ...	
8	24
Recording Index	Camera
1 Byte	1 Byte

IPv4

The ipv4 address of the recording device. If the device hasn't an ipv4 Address, this field should be set to invalid (zero ip 0.0.0.0). In that case a valid url has to be provided.

MAC

The hardware address of the recording device.

Recording Index

1 = Primary Recording, 2 = Secondary Recording

Camera

The camera index.

Lun Addr

The address of the lun a span is desired from.

16	32
Target ID	
4 Bytes	
Target IDX	LUN
1 Byte	1 Byte
	Reserved
	2 Byte
8	24

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target IDX

The index of the target.

LUN

The logical unit number.

Overwrite Retention Time

If this field is set (> 0) and no free spans are available, spans with retention times that are lower or equal to the specified retention time are accounted for export. In this case the recording with the retention time that expires next is overwritten.

Url

Url of the the device which requests the span as zero terminated ascii string. Max length is 128 bytes including zero termination. This parameter is optional but is required if the device doesn't has an ipv4 address or if the IPv4 adress of the Cam id is not used.

Response and Message Payload Structure

16		32	
Recording Camera/Storage Managing Host			
12 Bytes ...			
Span Address			
8 Bytes ...			
Last Recording			
16 Bytes ...			
State		Reserved	
1 Byte		3 Bytes	
8		24	

Recording Camera

The address of the device the span is assigned to, only in message payload(see request payload description for details).

Storage Managing Host

The address of the device the span was handed out, only in reply payload(hint: in older versions of that command, the recording camera info was send instead).

16		32	
reserved			
4 Bytes			
MAC			
6 Bytes ...			
		reserved	
		2 Bytes	
8		24	

MAC

The hardware address of the device, which handed out the span.

Span Address

The address of the span the device exports. If this field is zero, no span is exported.

16		32	
Target ID 4 Bytes			
Target IDX 1 Byte	LUN 1 Byte	Span IDX 2 Byte	
8		24	

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target IDX

The index of the target.

LUN

The logical unit number.

Span IDX

The index of the span on the lun.

Last Recording

The address of the span the device exports.

Recording Camera

The id of the camera of the recording that is overwritten. Field is zero, if there was no recording on this span. See request packet for detailed description.

Retention Time

The retention time (seconds since 2000) of the recording that is overwritten.

State

Values:

SUCCESS	0x00
NO SPAN AVAILABLE	0x01
STORAGE OFFLINE	0x02
INVALID SPAN MANAGER ADDRESS	0x03
ACCESS DENIED	0x04

A list of span manager the recording is using can be obtained by the command `CONF_REC_SPAN_MGR`.

CONF_CAM_REC_SPANS

Tag code	NumDes	Message	SNMP Support
0x0a8f	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Retrieve the list of recording spans of a camera from a span manager on a managed lun.
Write	p_octet	access_right_service	not supported.

Request Payload Structure

Recording Camera

The address of the camera for which recording spans are to be queried.

1632

IP

4 Bytes

MAC

6 Bytes ...

Recording Index

1 Byte

Camera

1 Byte

824

IP

The ip address of the recording device.

MAC

The hardware address of the recording device. This field may be zero if you search for recordings without considering the mac.

Recording Index

1 = Primary Recording, 2 = Secondary Recording

Camera

The camera index.

Lun Address

The address of the lun on which recording spans for a camera are searched.

1632

Target ID

4 Bytes

Target IDX

1 Byte

LUN

1 Byte

Reserved

2 Byte

824

Target ID

target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target IDX

The index of the target.

LUN

The logical unit number.

Response and Message Payload Structure

Lun Address 8 Bytes ...
N x Span Recording Info 16 Bytes ...

Recording Camera

The address of the recording camera (see request payload description for details).

Lun Address

The address of the lun of the recording spans (see request payload description for details).

Span Recording Info

Recording info about the spans the camera recorded.

16		32	
Span Index 2 Byte	S 1	Timezone 7 Bits	Flags 1 Byte
Start Time 4 Bytes			
Stop Time 4 Bytes			
Reserved 2 Bytes	File Count 2 Bytes		
8		24	

Span Index

The span index in the current lun.

S

The timezone sign.

Timezone

Timezone in quarter hours.

Flags

Values:

Bit 0	Continuous Recording
Bit 1	Recording Running
Bit 2	Migrated Recording

Start Time

Seconds since 2000.

Stop Time

Seconds since 2000.

File Count

The number of files that are stored in this span.

CONF_REC_SPAN_MGR

Tag code	NumDes	Message	SNMP Support
0x0a36	yes (1 - primary recording, 2 - secondary recording)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	
Write	p_octet	access_right_service	

Payload Structure

- Span Mananger IP address

The IP address of the device the span manager is running on.
- Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).
- Target Index

The iSCSI target index.
- Lun

The iSCSI lun of the storage.
- Priority

Priority as recording storage, higher values mean lower priority, 0 - highest priority
- Flags

Values:

OVERWRITE_OLDEST_RECORDINGS(obsolete)0x0001

If no free spans are available on all span manager of the devices recording span manager list, the recording with the retention time that expires next is overwritten.

Use this command to edit the recording span manager list. This list is consulted every time when a device is recording in VRM mode and its span list runs out resources. The entry with the highest priority is picked out of this list, the corresponding span manager is contacted and queried for spans. If the span manager is not accessable or will not return a span for some reason (maybe it has no more free spans to export), the entry with the next lower priority is picked out of the list. If at least one span manager for primary recording is configured, all entries of managed vrm (configured by CONF_MANAGING_VRM) will be deleted.

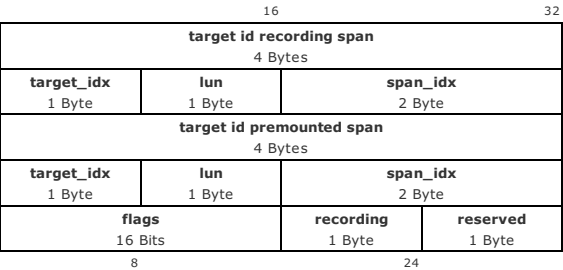

CONF_SPAN_REC_COPY

Tag code		NumDes	Message	SNMP Support
0x0a55		no	yes	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	obsolete	
Write	p_octet	access_right_service	obsolete	

CONF_SPAN_SWITCH

Tag code	NumDes	Message	SNMP Support
0x0a53	yes (cam)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported
Write	p_octet	access_right_service	switch spans, see detailed description

Payload Structure

target id recording span

the target id of the actual recording span

target_idx

the target index of the actual recording span

lun

the lun of the actual recording span

span_idx

the span index of the actual recording span

target id premounted span

the target id of the premounted span

target_idx

the target index of the premounted span

lun

the lun of the premounted span

span_idx

the span index of the premounted span

flags

these flags are used to specify the behav. of the command

<u>Flags:</u>	
FORCE	0x0001
CHECK_PREMOUNTED	0x0002
REPLACE_PREMOUNTED	0x0004
SWITCH_SPAN	0x0008
TARGET_RETREAT	0x0010
TARGET_REINTRODUCE	0x0020
ERROR_CHECK_PREMOUNTED	0x4000
ERROR_CHECK_RECORDING	0x8000

recording

select a recording

<u>Values:</u>	
primary recording	1
secondary recording	2

CONF_SPAN_SWITCH

This command can be used to influence the span usage of the recording. It is able to cause a replace of the premounted span and or switch to the next premounted span.

The flag SWITCH_SPAN causes the switch to the next span and releasing the actual recording

span. Flag REPLACE_PREMOUNTED will cause the release of the premounted span and mounting another one if available. If both flags are activated, the premounted block will be replaced, as soon as a new premounted span is mounted and available, the next step switch to premounted span will be performed. Before replacing the premounted span, the actual recording span will be checked, if the replace could get in conflict with a device internal triggered span switch. In that case the whole Span switch command will fail with rcv error RCP_ERROR_TRY_LATER, no switch or replace will be performed.

When performing a switch to next span job, the recording span address in the payload will be checked. If on execution of this job the recording span doesn't match the recording span from the payload, the switch will not be performed. When performing a replace premounted span job, the premounted span address in the payload will be checked. If on execution of this job the premounted span doesn't match the premounted span from the payload, the replace will not be performed. The idea of these checks is to avoid conflicts with the automatic span switching of the recording, that can lead to gaps in the recording and unwanted waste of recording spans. The flag FORCE will skip these checks. Flag CHECK_PREMOUNTED is only relevant for the switch to next span job without replacing the premounted span and without FORCE flag. If this flag is active on switching to next span, the premounted span parameter in the payload will be matched against the actual premounted span. If no match the switch won't be performed. If this flag including the FORCE flag isn't set on switch, a negative match will be performed on the premounted span. The TARGET_RETREAT Bit means, than a complete retreat from this target is intended, the span history will be modified in order to avoid a remount on that target. That state will stay active for that target until the device records on a new target and adds a span from the new target to the history, or if the span history will be cleared or the target will be reintroduced with the bit TARGET_REINTRODUCE. The TARGET_REINTRODUCE Bit is needed to undo a TARGET_RETREAT action, which is specially in the case needed, when a device shall return to a target, from that it had retreated earlier and no recording took place on another target between these events. In that case the remount feature for that target is still disabled. The TARGET_REINTRODUCE Bit will reenables the remount feature for that target without the necessity of clearing the whole span history.

Warning: A possible conflict, when requesting a replace of the premounted span with an automatic span switch of the recording that causes gaps in the recording is unavoidable. So an excessive usage of replacing premounted spans should be avoided.

CONF_HD_SET_VRM_LOCK

Tag code	NumDes	Message	SNMP Support
0x0a5d	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported
Write	p_octet	access_right_service	Write or clear the vrm lock.

Payload Structure

Target ID

Target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES)

target idx

Target index of the storage device

lun

Lun of the storeage device

flags

flags

Flags:		
SET_VRM_LOCK		0x01

CONF_HD_SET_VRM_LOCK

This command sets or clears the vrm lock on a lun. If the flag SET_VRM_LOCK is set the vrm lock will be written, otherwise it will be cleared.

CONF_SPAN_FILES_DIR

Tag code	NumDes	Message	SNMP Support
0x0aa1	yes (entry index 1 - 32768)	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	Read the path entry end exported iscsi addr. (gen dll only)
Write	p_octet	access_right_service	Set path to span files (gen dll only).

Payload Structure (write/in)

Action 4 Bytes			
reserved 8 Bytes ...			
Path name 1 1 Byte	N x 1 Byte	Path name N 1 Byte	

Action

specifies the action, you can set an entry or clear an entry

Values:

clear entry	0
set entry	1

Path name 1 - N

zero terminated ascii string containing the full path to a span formated storage mounted on windows or directory containing the span files, the path should not end with a '\', payload size must be set, that it includes the zero termination

Payload Structure (read; write/out)

exported target id 32 Bits			
target index 1 Byte	lun 1 Byte	reserved 2 Byte	
error 32 Bits			
path 1 1 Byte	N x 1 Byte	path N 1 Byte	

exported target id

target id of the exported lun, specified by the directory path.

target index

target index of the exported lun, specified by the directory path.

lun

lun id of the exported lun, specified by the directory path.

error

Error code, in case of set path failed. Is always 0 in the payload of read direction. Only relevant for return payload of write direction.

Values:

no error	0
invalid directory path	1
invalid lun info file	2
common error	3

path 1 - N

path to a mounted span formatted storage or directory containing the span files.

CONF_SPAN_FILES

This command allows to set the path to a mounted span formatted storage or directory. You have to send the in payload to set the path. The min payload size is 16 bytes. The max path name length is 1024 bytes including the zero termination. payload size must be set to the size that includes the zero termination but min size is 16 bytes even in case of an empty string (at least zero termination). You can set up to 32768 pathes. Use the num param to specify the index of an entry. If you set the path it will check the path. To pass this check, at least a valid Lun info file (INFO.TXT) has to exist. The span are needed later when accessing the storage(e.g header access, replay). The response to the write direction is has the out payload format. If success the error field is zero and the payload includes the set path and the

exported lun address. This storage is now accessible by using this address for other commands. if the set failes, the error field is non zero and contains an error code. It is allowed to set path on an index that was already set. The old values will be overwritten, but remember that the effect takes place later, if there are still open references based on the old entry (e.g. running replay, header access).

The cmd can be used for read direction. The response payload contains the export lun address and the path. error code is always zero. If the entry is empty, the path is empty and has only the zero termination.

CONF_SPAN_HISTORY

Tag	code	NumDes	Message	SNMP Support
	0x0ace	no	no	no
	Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	read span history	
Write	p_octet	access_right_service	clear span history or add a span history entry	

Payload Structure

cam 16 Bits	rec idx 16 Bits
action 16 Bits	cnt 16 Bits
span address 1 8 Bytes ...	
N x 8 Bytes	span address N 8 Bytes ...

cam
camera line from 1 to max cam

rec idx
recording index from 1 to 2

action
action to do in this command, the command can show the span history, clear the complete history, add a new entry to the history, or show the remount span

Values:

show (read direction only)	0
add(write direction only)	1
clear(write direction only)	2
show remount(read direction only)	3

cnt
number of span address following in this command payload. For action show you can specifie the max number of span history entries to show for in payload. the reply payload will then return a max. of this number of span address. max 8.

span address 1 - N
range of span address from 0 to cnt, maximum 8.

span address content (8 bytes)

target id	4 bytes
target index	1 byte
lun	1 byte
span index	2 bytes

CONF_SPAN_HISTORY

This command is used by the device to store the span history in the device config, that means it adds (action add) an span adress entry to the config, for each recorded span. The history can be seen by read commando and action show. The history can be cleared by sending a action clear command.

CONF_ACCESS_LUN_MGMT_FILE

Tag code	NumDes	Message	SNMP Support
0x0ae2	yes	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_service	Access span header information.
Write	p_octet	access_right_service	Access lun management information.

Payload Structure

target id

target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES)

targ idx

target index of the lun

lun

lun

data

user data to read/write from/to the lun mgmt file

CONF_ACCESS_LUN_MGMT_FILE

This command can be used to access the lun management file. This exists only on span formatted luns, which were formatted by firmware /generic dll versions, that are able to create this file. Older versions cannot do this. The file name is "lunmgmt.bin". The maximum size which can be stored is 504 bytes. The in-payload for reading or writing this command has to be at least a size of 12 bytes and includes the lun address for read/write from/to lun mgmt file. The response on the read direction includes the user data from the lun mgmt file. The data length will be the remaining bytes from the response payload size minus the lun address and the reserved bytes (12 bytes together). Same in write direction. The payload size determines the number of bytes to write to the lun mgmt file (max 504 bytes).

CONF_FLUSH_LUN_INFO_CACHE

Tag code		NumDes	Message	SNMP Support
0x0b09		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	not supported	
Write	p_octet	access_right_service	flush the lun info cache of lun: 4 bytes IP as DWORD in network byte order, 1 byte target idx, 1 byte lun, 2 bytes reserved (if ip is 0.0.0.0 or 255.255.255.255 or the payload is less than 6 bytes it is asumed as wildcard, the whole cache will be flushed)	

CONF_DELETE_CAM_REC_SPANS

Tag code	NumDes	Message	SNMP Support
0x0b5d	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	not supported.
Write	p_octet	access_right_service	Delete recording spans of a camera from a span manager on a managed lun.

Request Payload Structure

16	32
Recording Camera	
12 Bytes ...	
Lun Address	
8 Bytes ...	
From	
8 Bytes ...	
To	
8 Bytes ...

8	24

Recording Camera

The address of the camera for which recording spans are to be deleted.

16		32	
IP			
4 Bytes			
MAC			
6 Bytes ...			
		Recording Index	Camera
		1 Byte	1 Byte
8		24	

IP

The ip address of the recording device.

MAC

The hardware address of the recording device. This field may be zero if you search for recordings without considering the mac.

Recording Index

1 = Primary Recording, 2 = Secondary Recording

Camera

The camera index.

Lun Address

The address of the lun on which recording spans for a camera will be deleted.

16		32	
Target ID			
4 Bytes			
Target IDX	LUN	Reserved	
1 Byte	1 Byte	2 Byte	
8		24	

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES).

Target IDX

The index of the target.

LUN

The logical unit number.

From

Start time of the interval in Seconds since 2000 local time for deleting.

To

End time of the interval in Seconds since 2000 local time for deleting.

Flags

<u>Values:</u>	
Bit 0	delete enclosed spans only
Bit 1	force delete

DELETE_CAM_REC_SPANS

This command is used for deleting spans of a specific recording line and index containing recordings between a given time interval. The flag "delete encloses spans only" chooses wether a span shall be deletet if it is completetly enclosed by the time interval or if it only overlaps the interval. The flag "force delete" will delete all spans of the cam independend of the state of the span. That means even if the cam is still recording on a span, the span will be deleted. So use this option very carefully, as it could lead to inconsitencies. If the command return successfully, it doesn't mean, that the deletion is completetd, it just tells the caller, that a asychonous job for deletion was invoked. The command has to be send to the storage lun managing device.

CONF_HDD_VCD_CACHE_SIZE

Tag code	NumDes	Message	SNMP Support
0x0b79	no	no	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	see detailed description
Write	p_octet	access_right_service	see detailed description,

Payload Structure

16		32	
line	rec idx		
16 bit	16 bit		
lower size limit	upper size limit		
16 bit	16 bit		
8	24		

line

Line from 1 to n.

rec idx

Rec index: 1 - primary recording, 2 - secondary recording.

lower size limit

Lower size limit of used vcd cache buffer on recording spans in 64 kb units per 1 GB span. Allowed values from 1 to 4096, 0 to disable cache.

upper size limit

Upper size limit of used vcd cache buffer on recording spans in 64 kb units per 1 GB span. Allowed values from 1 to 4096, 0 to disable cache.

CONF_HDD_VCD_CACHE_SIZE

This command can be used to configure the size of the vcd cache on a span for recording. The size parameters are relativ to 1 GB span size. If recording is running on soans with different sizes than 1 GB, the values will be internally scaled to the proper size, so it will also work for different span sizes. The usage of a vcd cache on spans will cause space overhead on a storage, so it is possible to switch it of by setting both values to 0. If enabled, the recording will use these values to adjust the size of the vcd cache on spans. The used adjusted sizes will be than limited by these two values, upper limit and lower limit. The adjusment starting value will be between these to values. While recording, the uses space for cached vcd data will be measured and after each span switch, the size will be adjusted by using the measurement values for new mounted spans in order to avoid overhead. It is also possible to set a fix size for the vcd cache by this command by setting the upper and lower limit to equal values. The default value for the command is 1 for lower limit and 128 for upper limit. For read direction an input payload is needed same as the described payload but only line and rec idx are required, the remaining part of the payload can be clipped away.

CONF_SPAN_CERTIFICATES_LIST

1 Byte	1 Byte	2 Byte
Certificate		
n bytes		

Timestamp

Local time in seconds since 2000

TZ QH

Timezone offset (from utc) in quarter hours as signed char value

Length

Length of the Certificates List Entry (certificate including these 8 bytes header infos)

Certificate

One certificate

CONF_SPAN_CERTIFICATES_LIST

This Command can be used to query the certificates of a span, in order to verify the signed video record data within that span. The response will deliver all certificates of the specified span and time intervall. The maximum size of the response can be limited by the caller but it will not exceed 16 kb for the certificates list. If the response payload size isnt't enough to hold all valid certificates, a flag in the response will signal the existence of further certificates, which didn't fit in the response payload. A second query in that case with a smaller time interval may help to get the remaining certificates. The response will have a certificates list with several enries of different size, there are no gaps between the entries.

CONF_STORAGE_REPORT

Tag code	NumDes	Message	SNMP Support
0x09cf	yes (1=cam1, 2=cam2, ...)	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get information about the storage device
Write	p_octet	access_right_service	not supported

Request packet

To get information about a storage device, a read packet with no payload must be send to the rcp server.

Response packet

The server reply will have the following structure:

Type 1 Byte	Availability 1 Byte	Access Type 1 Byte	IO Error Type 1 Byte
IO Error Count 4 Bytes			
Throughput Read 4 Bytes			
Throughput Write 4 Bytes			
iSCSI Login Connection 1 4 Bytes			
N x 4 Bytes	iSCSI Login Connection N 4 Bytes ...		

Type

Values:

1 Byte	1 Byte	1 Byte	1 Byte
reserved		Flags	Storage threshold
2 Bytes		1 Byte	1 Byte
8		24	

Storage Type

The type of the storage.

Values:

FILE	0x02
RAM	0x03
ISCSI	0x04
USB	0x05
IDE	0x08
CF	0x09
SD	0x0b
SMB	0x11
SD OVER USB	0x16

Target ID

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES). Will be ignored, if the storage type is not iscsi.

Target Index

The target index on the iscsi server. Will be ignored, if the storage type is not iscsi.

Lun

The iscsi lun. Will be ignored, if the storage type is not iscsi.

Rec Region Size

Size in GB from the Storage used for recording. Default is 0 which means as much recording space as the storage size allows. The same will happen, if this Size is to big for the storage.

Fmt Progress

If the storage is in state formatting, the field indicates the formatting progress in percentage.

Utilization

If the storage is span formatted, this field indicates the amount capacity used (in percentage).

iSCSI export

Values:

For local use only	0x00
Make storage available through iSCSI	0x01

Span Manager

Values:

Span manager off	0x00
Span manager on	0x01
Span format lun and start span manager	0x02
Migrate lun and start span manager	0x03
read only mode	0x04
erase lun and format	0x05

Mgr Status

The status of the span manager in the response packet. Set to zero in the request packet.

Values:

OFF	0x00
ON	0x01
FORMATING	0x02
MIGRATING	0x03
ALARM THRESHOLD (msg only)	0x04
ALARM OVERWRITE (msg only)	0x05
OFFLINE (read payload only)	0x04
ONLINE (read payload only)	0x05
STOPPING	0x06
ERROR	0x07
ONLINE (WRITE PROTECTION)	0x08

Mgr Error

If the span manager status is ERROR, this field contains details of the error that occurred. See command CONF_SPAN_USE_STATUS for possible error codes.

Flags

Values:

default setting	0x01	just info, that this is a default setting
-----------------	------	---

Storage threshold

This is the threshold of free storage in percent and means that at least this amount of memory should be free. A Message of this command will be send always, this treshold is crossed in eiber direction.

Use this command to configure and manage local or remote storage. The storage list may contain up to 16 entries. If a remote (iscsi) storage is to be managed, the lun address has to be specified. Realize, that if you export an remote storage, the device will have performance drawbacks cause the ip- and iscsi-stack will be passed through twice. Prefer to access the remote storage directly instead.

The storage lun can be write protected. If this state was recognized, the Mgr Status will inform about this state by the value "WRITE PROTECTION". There are three ways for a storage lun to become write protected here. First to configure explicite the storage lun(Span Mgr) to be in read only mode, second by a defect storage lun, which will cause a fall back into a write protection mode, and third if the storage is set physically to write protection (e.g. user moves the lever on the sd card into the write protection position).

The storage devices will be exported through iscsi in the order of this list (storage devices with the 'iSCSI export' field set to 'For local use only' [0x00] are omitted) and the storage will appear in the same place of the target name list of an iscsi discovery on that device.

This command will be send as msg (can also be send as snmp trap with same payload) in case of crossing the storage threshold with Mgr status ALARM THRESHOLD or in case of overwriting recording, that is still protected by unexpired retention time with mgr status ALARM OVERWRITE.

NOTE

If the storage list is empty or only contains entries with the 'iSCSI export' field set to 'For local use only' (0x00), the iscsi server is stopped, if it is running, cause no targets and luns would be provided. If the list contains at least one entry with the 'iSCSI export' field set to 'Make storage available through iSCSI' (0x01), the iscsi server is started, if not already running, to provide the iscsi service. The iscsi server can be controlled through the command `CONF_ISCSI_SERVER_STATE` too.

CONF_STORAGE_IO

Tag code	NumDes	Message	SNMP Support
0x0a61	no	yes	no
Datatype	Access Level	Description

Mode		Flags	
2 Byte		2 Byte	
ID			
4 Bytes			
Action	Reserved		
1 Byte	3 Bytes		
Reserved			
44 Bytes ...			
8		24	

Lun Address

The address of the storage.

16		32	
iSCSI IP			
4 Bytes			
Target Idx	Lun	Reserved or Span Idx	
1 Byte	1 Byte	2 Byte	
8		24	

iSCSI IP

The ip address of the iscsi server

Target Idx

The index of the target on the iscsi server.

Lun

The logical unit.

Span Idx

The index of the span. Only used, if the flag RESTRICT TO SPAN is set.

Start Burst Size

The size in LBAs of the burst the test starts with. This value must be lower or equal to the end burst size.

End Burst Size

The size in LBAs of the burst the test ends with. This value may be clipped to the maximum burst value of the storage.

Burst Size Duration

The number of milliseconds each bust size is read and written.

Burst Size Increase

The number of LBAs the burst size is increased after each burst-duration.

Maximum Read Rate

The maximum datarate that is read in KBit/sec.

Maximum Write Rate

The maximum datarate that is written in KBit/sec.

Repeat

The number of times the test is repeated which means how often the specified burst sequence is run.

Mode

The test may run in the following modes. The modes RECORDING SIMULATION, LATENCY and REPLAY SIMULATION use different fields in the request packet which are not documented yet.

Values:

LINEAR	0x0000
RANDOM	0x0001
RECORDING SIMULATION	0x0002
LATENCY	0x0003
REPLAY SIMULATION	0x0004

If the mode is set to LINEAR then the test reads/write from/to consecutive lba addresses. If the maximum lba is reached and the STORAGE_IO_FLAG_MAX_LBA_END flag is set, the test stops. Otherwise the test wraps its lba pointer to the beginning of its storage.

If the mode is set to RANDOM then the test reads/write from/to randomly chosen lba addresses of the storage.

Flags

Flags to set some options.

Values:

READ ONLY	0x0001
WRITE ONLY	0x0002
KEEP DATA	0x0008
VERIFY WRITE	0x0010
EXP BURST INCREASE	0x0020
ERROR STOP	0x0040
RESTRICT TO SPAN	0x0080
ISCSI SESSION EXCLUSIVE	0x0100
MAX LBA END	0x0200

If the READ ONLY flag is set, only read operations are performed. May not be used simultaneously with the WRITE ONLY flag.

If the WRITE ONLY flag is set, only write operations are performed. May not be used simultaneously with the READ ONLY flag.

If the KEEP DATA flag is set, all lbas that are written are read before so that no recording data should be destroyed. Be careful that no one else writes to this lun simultaneously. In the latter case data on the storage could be lost.

If the VERIFY WRITE flag is set, every lba that was written is read afterwards to verify that the data was correctly written.

If the EXP BURST INCREASE flag is set, the field 'Burst Size Increase' is ignored. Instead the burst size is doubled after each rnu.

If the ERROR STOP flag is set, the tests stops when an io error occurs.

If the RESTRICT TO SPAN flag is set, the tests only uses the span of the lun, which is specified in the 'Span Idx' field of the lun-address.

If the ISCSI SESSION EXCLUSIVE flag is set, the tests use an exclusive iscsi session which is not shared among other tests.

If the MAX LBA END flag is set, the tests stops when the write pointer reaches the maximum lba address of the lun/span (only in sequential access mode).

ID

Identifier of the storage io. Set to zero when starting a new storage io. Set to the from the start request returned value for stopping a storage io.

Action

Values:

STOP	0x00
START	0x01

WRITE	0x05
WRITE VALIDATE	0x06

Repeat Count

The number of turns the test repeated so far.

Current Burst Size

The number of LBAs of the current burst.

Current Offset

The current position of the i/o pointer in percentage of the whole storage. This value is not significant in random access mode.

Current Read Datarate

The current read datarate in KBit/s.

Current Write Datarate

The current write datarate in KBit/s.

Read Bytes

The number of bytes that were read since the test was started.

Write Bytes

The number of bytes that were written since the test was started.

Read Operations

The number of read operations successfully performed since the test was started.

Write Operations

The number of write operations successfully performed since the test was started.

Read Errors

The number of read errors since the test was started.

Write Errors

The number of read errors since the test was started.

8	24

offset

the offset in lba sized units (= 512 bytes)

len

amount of data to copy in lba sized units (= 512 bytes), not relevant for destination descriptor

Values:

full copy	0
len	1 to n

type

type of the source or destination

Values:

interface test	0
span on iscsi	1
file	2
raw iscsi lun	3

type spec. params len

length of the following additional parameters

type specific parameter

additional parameter for specifying the source or destination depending on the type of the source or destination (see description for specific parameters below).

interface test

Fakes the access to a source/destination and can be used for example to test the interface and copy job engine. No further parameters are needed.

specific parameter structure for "span on iscsi"

target id

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES)

target

Target index

lun

lun index

span index

span index

file type

type to specify, which part of the span has to be copied

<u>Values:</u>	
lock header	1
unit header	2
manager header	3
recording data	4

timeout

request timeout in seconds, can be used to tolerate iscsi connection problems

<u>Values:</u>	
default, using default iscsi timeouts	0
possible values	1 - 65534
never timeout	65535

span on iscsi

Access to a span on an iscsi lun. This type can be used for example to copy a span. The parts of a span (unit, lock, mgr header, data) has to be copied in separate copy jobs. Parameter length is 12 bytes.

specific parameter structure for "file"

file path

zero terminated ascii string specifying the path and file name of a source/destination

file

Access to a file. Can be used for example to copy a span to a file. If the file is the source, it has to exist. If the file is destination it will be created if it doesn't exist. Parameter length is the path length including zero termination and stuffing bytes in order to be 4 byte aligned. Size is at least 4 bytes.

specific parameter structure for "raw iscsi lun"

target id

The target id of the lun (may be the ipv4 address for older versions or with default target resolve configuration, see CONF_TARGET_ID_RESOLVE_RULES)

target

Target index

lun

lun index

timeout

request timeout in seconds, can be used to tollerate iscsi connection poblems

<u>Values:</u>	
default, using default iscsi timeouts	0
possible values	1 - 65534
never timeout	65535

raw iscsi lun

Access to a complete iscsi lun. This type can be used for example to make a one to one copy of a complete lun. Parameter length is 8 bytes.

Tag code		NumDes	Message	SNMP Support
0x0b33		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	not supported	
Write	t_dword	access_right_service	requests stop on a data copy job if exists, otherwise fails, payload: job id	

CONF_DATA_COPY_JOB_STATUS

Tag code	NumDes	Message	SNMP Support
0x0b34	no	yes	no
Datatype	Access Level	Description	
Read	p_octet	access_right_minimal	get the status of a copy job,
Write	p_octet	access_right_service	write not supported (only for read and messages),

Payload Structure

job id

Id of a data copy job

state

state of the copy job

Values:	
initializing	0
running	1
finished	2
failed	3
stopped	4

progress

Progress in lba units (= 512 bytes)

full data amount

Full data amount in lba units (= 512 bytes) of the copy job. Progress has to reach this value in order to finish successfully.

CONF_DATA_COPY_JOB_STATUS

This message reports the status of the copy job and will be send on each status change or several times while in state "running". The status can also be queried by sending this command in read direction.

CONF_STORAGE_TARGET_ID

Tag code		NumDes	Message	SNMP Support
0x0c09		no	no	no
Datatype		Access Level	Description	
Read	t_dword	access_right_minimal	get the storage target id, if there is no explicite configured (default 0), it returns the device unit ipv4 address	
Write	t_dword	access_right_service	set the storage target id of this device which is an system wide unique identifier, which can be used to resolve it to connect to the local iscsi exported storage (0 means default)	

CONF_TARGET_ID_RESOLVE_RULES

Tag code		NumDes	Message	SNMP Support
0x0c0a		no	no	no
Datatype		Access Level	Description	
Read	p_octet	access_right_minimal	get the target id resolve rules, see detailed description	
Write	p_octet	access_right_service	set the target id resolve rules, see detailed description	

Payload Structure

target id resolve rule 0
276 Bytes ...
...
target id resolve rule n
276 Bytes ...

target id resolve rule 1 - n

Upto 127 target id resolve rules. The payload contains all rules to be changed or to be added in write direction or all valid rules for read direction, at least one zeroed rule if there are no rules actual configured.

target id resolve rule structure

16		32	
target id range start			
4 Bytes			
target id range end			
4 Bytes			
index	priority	type	
2 Bytes	1 Bytes	1 Bytes	
reserved			
4 Bytes			
type specific parameter ...			
256 Bytes			
...			
8		24	

target id range start

Begin of the target id range including the specified id of the rule.

target id range end

End of the target id range including the specified id of the rule.

index

Index of the target id resolve table, where to change the actual entry. Valid range is 0 to 127, as the table has an actual size of 128 entries.

priority

The rules target id range my overlap, therefor the priority will be used, which rule wins in conflic case. The valid range is from 0 to 255, where 0 is the lowest priority and 255 the highest.

priority

The rules target id range my overlap, therefor the priority will be used, which rule wins in conflic case. The valid range is from 0 to 255, where 0 is the lowest priority and 255 the highest.

Values:			
NONE	0x00	no rule (delete rule)	
DIRECT_IPV4	0x01	target id is the ipv4	
ISCSI_SERVER	0x02	iscsi server parameter	
SMB_SERVER	0x03	smb server parameter	

ISCSI Server specific parameter

16	32
----	----

url

The url of the iscsi server as zero terminated ascii string. Only ipv4 as string is actual supported.

port

The port of the iscsi service socket on the server. Default 0 means use the default port. Actual it is just a place holder and other ports than the the default port are not supported.

SMB Server specific parameter

url

The url of the smb server as zero terminated ascii string. Only ipv4 or ipv6 as string is actual supported.

path

The path on the smb server as zero terminated ascii string.

port

The port of the smb service socket on the server. Default 0 means use the default port. Actual it is just a place holder and other ports than the the default port are not supported.

CONF_TARGET_ID_RESOLVE_RULES

This command configures the rules for resolving a storage target id to the parameter for connecting the storage server. The target id is an 32 bit system wide unique identifier and replaces the ipv4 addresses for storages. The display format of an id in text will be "xxx.xxx.xxx.xxx" like ipv4 addresses. There are special values for the target id, which are 0.0.0.0 for invalid target id, 255.255.255.255 for wildcard and 127.0.0.1 for the local target in order to be backward compatible with older devices and software which expect an ipv4 address instead. The default state for the configured rules contains only one rule for the complete range 0.0.0.1 to 255.255.255.254 and lowest priority 0 for DIRECT_IPV4 for backward compatibility. In order to change or add rules, all which shall be changed or added needs to be send including the table entry index. Entries which shall not be changed doesn't need to be send. Also the read response payload will only contain valid rules, except if the table is empty, in that case only one empty rule will be in the payload.

NOTE

On the Generic (Windows and Linux) the whole table will be persisted in the table. The generic dll won't persist it. All other devices will only persist the first four valid rules.

CONF_INTERNAL_STORAGE_ENCRYPTION

Tag code	NumDes	Message	SNMP Support
0x0c43	no	no	no
Datatype	Access Level	Description	
Read	t_octet	access_right_minimal	enable : 1 or disable : 0 the xts encryption (no influence on device with permanent encryption)
Write	t_octet	access_right_service	enable : 1 or disable : 0 the xts encryption (no influence on device with permanent encryption)

CONF_HDD_RECORD_ENCRYPTION

Tag code	NumDes	Message	SNMP Support
0x0c80	record index 1 (primary) or 2 (secondary)	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	hdd record encryption (span encryption only) : bit 0 -> line 1; bit 1 -> line 2; bit n - 1 -> line n
Write	t_dword	access_right_service	enable the hdd encryption (span encryption only) : bit 0 -> line 1; bit 1 -> line 2; bit n - 1 -> line n (0 - disabled (default streaming gateway), 1 - enabled (standard default)), additional a valid certificate for usage record encryption required in order to have a working record encryption

CONF_HDD_RECORD_ALARM_RING_INIT_SIZE

Tag code	NumDes	Message	SNMP Support
0x0cdf	-	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	initial alarm ring size on storage in MB (min 1 MB, max 128 MB, default 16 MB)
Write	t_dword	access_right_service	initial alarm ring size on storage in MB (min 1 MB, max 128 MB, default 16 MB)

CONF_HTTP_LIVE_BITRATE

Tag code	NumDes	Message	SNMP Support
0x0b45	no	no	no
Datatype	Access Level	Description	
Read	t_dword	access_right_minimal	Get the bitrate in kBit the HTTP Live Streaming has allocated buffers for
Write	t_dword	access_right_service	Set the bitrate in kBit the HTTP Live Streaming should allocate buffers for (max bitrate given in init gen)

CONF_HTTP_LIVE_AUDIO

Tag code	NumDes	Message	SNMP Support
0x0b46	no	no	no
Datatype	Access Level	Description	
Read	f_flag	access_right_minimal	Audio is enabled for HTTP Live Streaming yes or no
Write	f_flag	access_right_service	Audio enabled for HTTP Live Streaming yes or no

Appendix - Bicom Command Access Levels

The default protection level for BICOM / AUX commands is 'bl_user' for get-operations (get, getMax, getMin) and 'bl_service' for all other operations. All BICOM / AUX commands which have a protection level different from the default are listed in the following tables. 'bl_priv' means that the command is not accessible at all.

Device Server objects

ObjectID	Operation	Level
0x0160	BICOM_OP_GET	BL_SERVICE

Camera Server objects

Appendix - specific error codes

Each rcp command can generate an generic RCP fault as described in the chapter "Rcp Protocol Procedure". Additional command specific error codes are defined. If an command specific error occurs the Response is 2 bytes long. The first byte is set to RCP_ERROR_COMMAND_SPECIFIC (0xf0), the second byte is set to the specific fault.

The following command specific errors are defined:

Storage specific error codes

Span errors

SPAN_ERROR_INV_SPN_IDX	0x02
SPAN_ERROR_INV_SPN_IDX	0x02
SPAN_ERROR_INV_HDR_TYPE	0x03
SPAN_ERROR_INV_ADDR_LIST	0x04
SPAN_ERROR_NOT_MNTD	0x05
SPAN_ERROR_INV_FS	0x06
SPAN_ERROR_INV_LUN_NFO	0x07
SPAN_ERROR_BAD_HDR_CKSM	0x08
SPAN_ERROR_INV_IDX	0x09
SPAN_ERROR_RD_ONLY	0x0a
SPAN_ERROR_NO_REC_DAT	0x0b
SPAN_ERROR_INV_PART_NFO	0x0c
SPAN_ERROR_CONV_REC	0x0d
SPAN_ERROR_SPAN_REQUEST_FAILED	0x0e
SPAN_ERROR_SPAN_REQUEST_RETENTION_TIME	0x0f
SPAN_ERROR_REMOUNT_REFUSED	0x10
SPAN_ERROR_OLD_LUN_NFO	0x20

HDD PMM errors

HD_PMM_ERROR_TIMEOUT	0x12
HD_PMM_ERROR_CREATE_FAILED	0x22
HD_PMM_ERROR_ACCESS_DENIED	0x32
HD_PMM_ERROR_DEVICE_PRESENT_TIMEOUT	0x42
HD_PMM_ERROR_LUN_LOCK	0x52
HD_PMM_ERROR_INVALID_ACCESS	0x62
HD_PMM_ERROR_LUN_MGMT_FILE_NOT_FOUND	0x72
HD_PMM_ERROR_LUN_WRITE_PROTECTED	0x82
HD_PMM_ERROR_COMMON	0xf2

ISCSI errors

ISCSI_ERR_CONNECT	0x31
ISCSI_ERR_INV_LUN	0x33
ISCSI_ERR_LOGIN	0x34
